

# 2018 IHARF Agronomy Update

Chris Holzapfel, MSc PAg

# Presentation Overview

- **Faba bean Row Spacing x Seed Rates (2018)**
- **Flax Seed Treatments & Foliar Fungicides (2018, multi-site)**
- **Canola Seed-placed P Fertilizer Forms & *P. bilaiii* inoculation (2018)**
- **4R N Management Trials in Wheat & Canola (2017-18)**
- **Wheat Input Demo (2018)**

# Faba bean Response to Row Spacing & Seed Rate (ADOPT)

# Seed Rate & Row Spacing Effects on Faba bean Indian Head 2018

## Objectives

- To demonstrate the response of faba beans to varying row spacing with a focus on establishment, ability to compete with weeds, maturity and yield
- To gather additional information on faba bean seeding rate response & assess whether the observed seeding rate responses are affected by row spacing

## Treatments (12)

Row Spacing (4): 10", 12", 14", & 16"

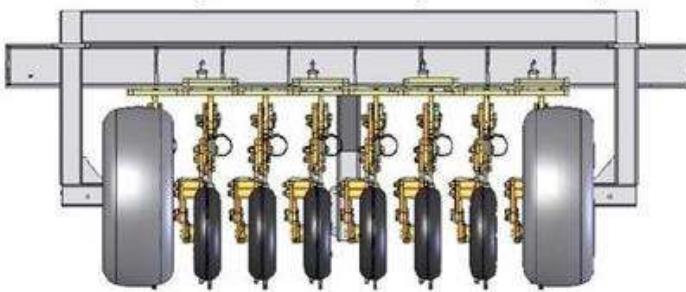

Seeding Rates (3): 25, 45, & 65 seeds/m<sup>2</sup>

# IHARF-SeedMaster Plot Drill on Various Row Spacing Configurations

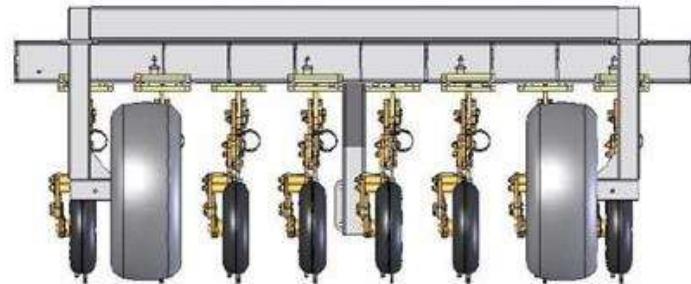

**10 inch spacing**

(7.5' seeded plot width)

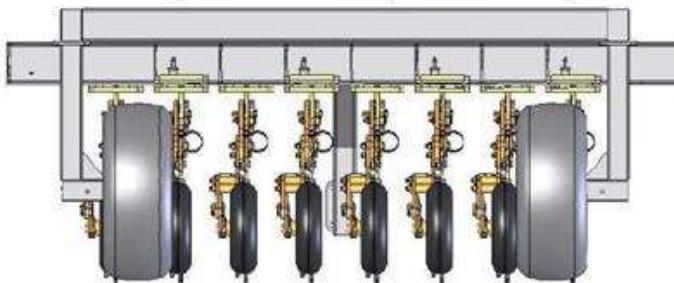

**14" cm Spacing**

(9.3' seeded plot width)

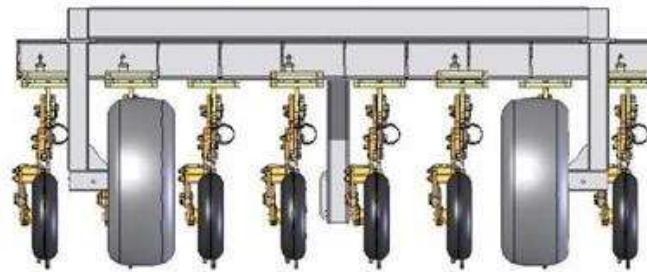

**12" cm spacing**

(8.0' seeded plot width)

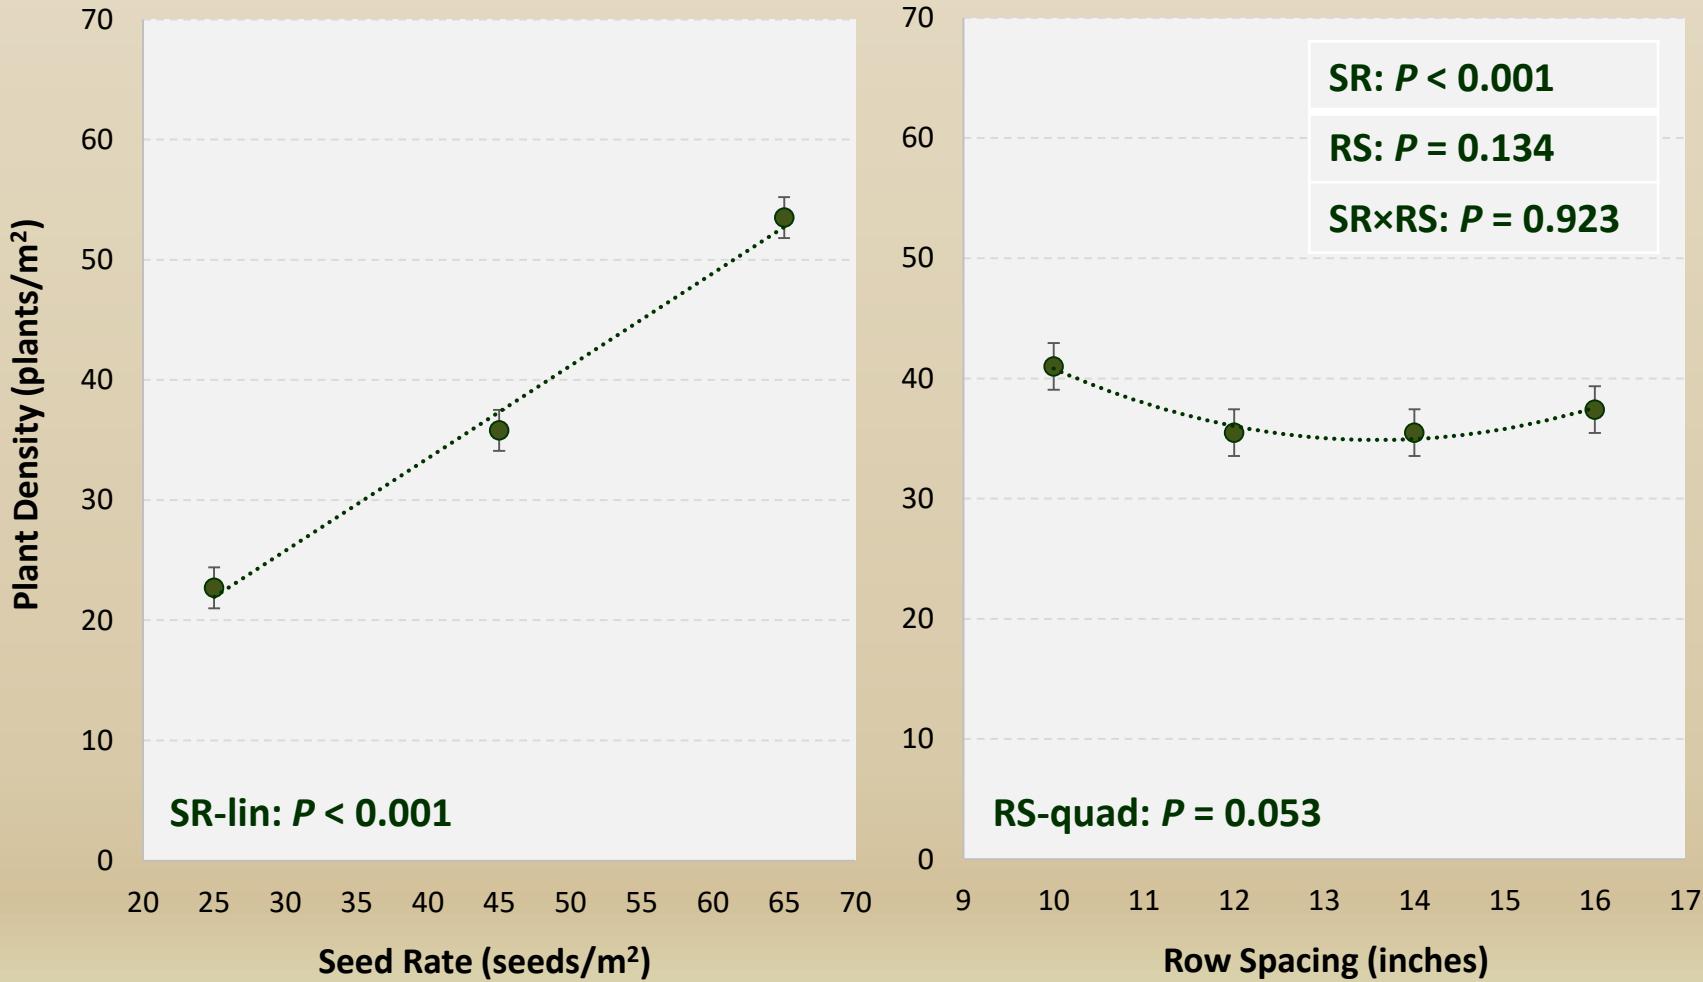

**16" cm Spacing**

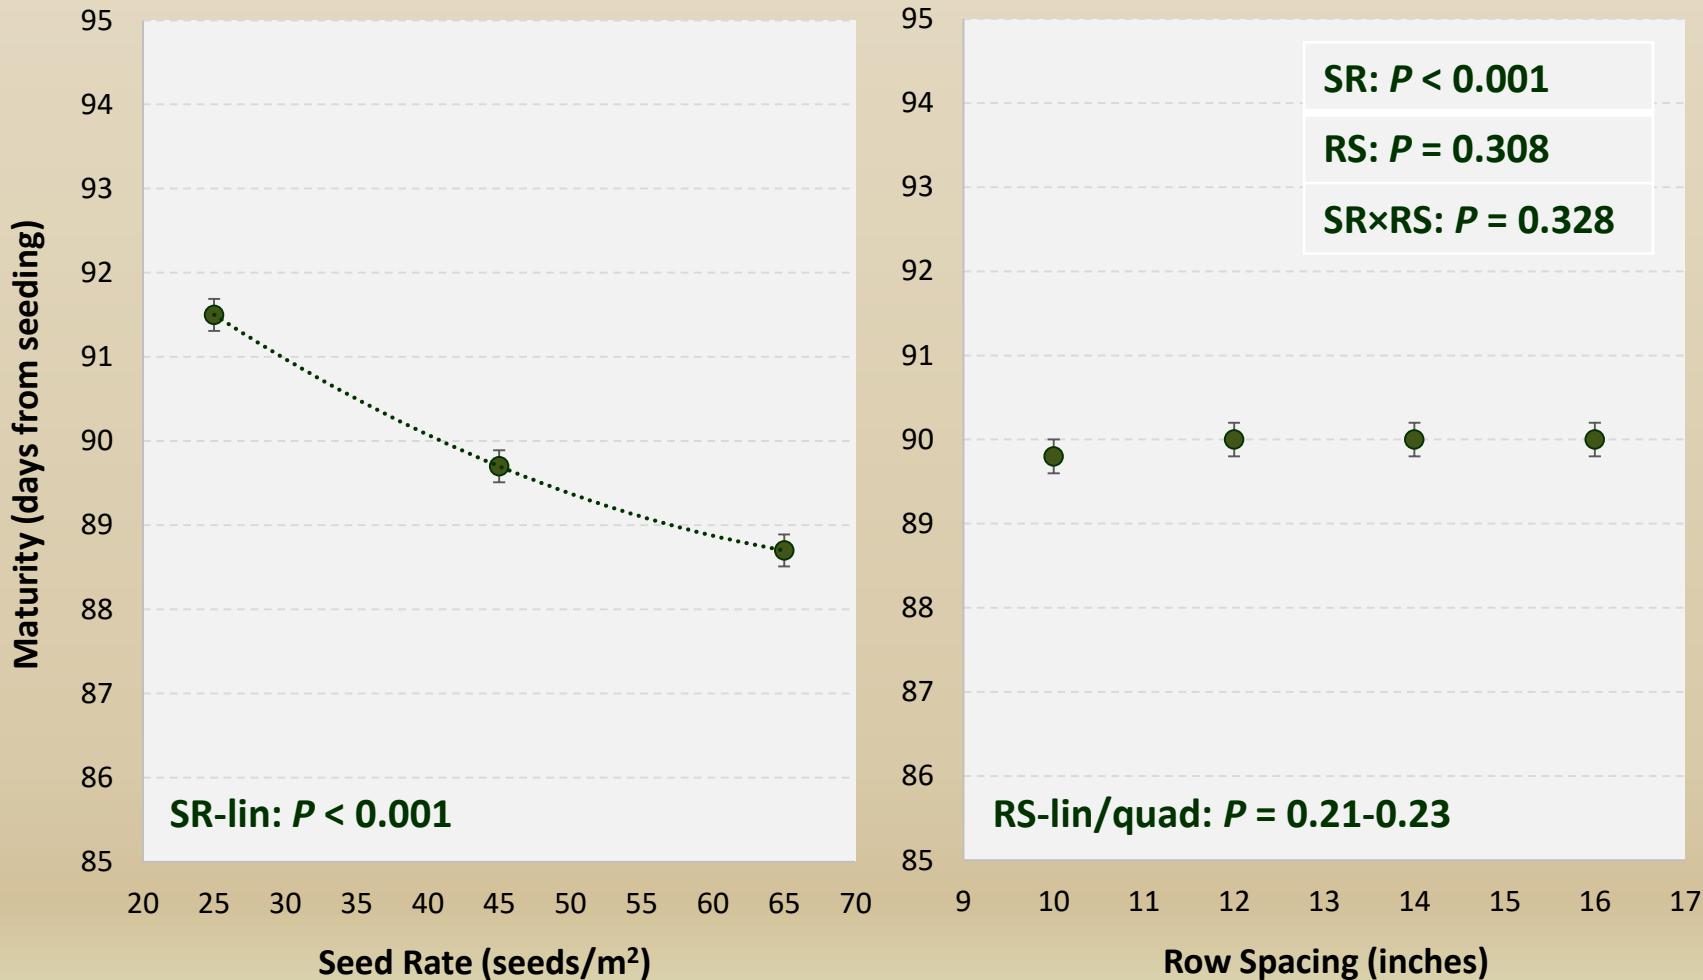

(10.7' seeded plot width)

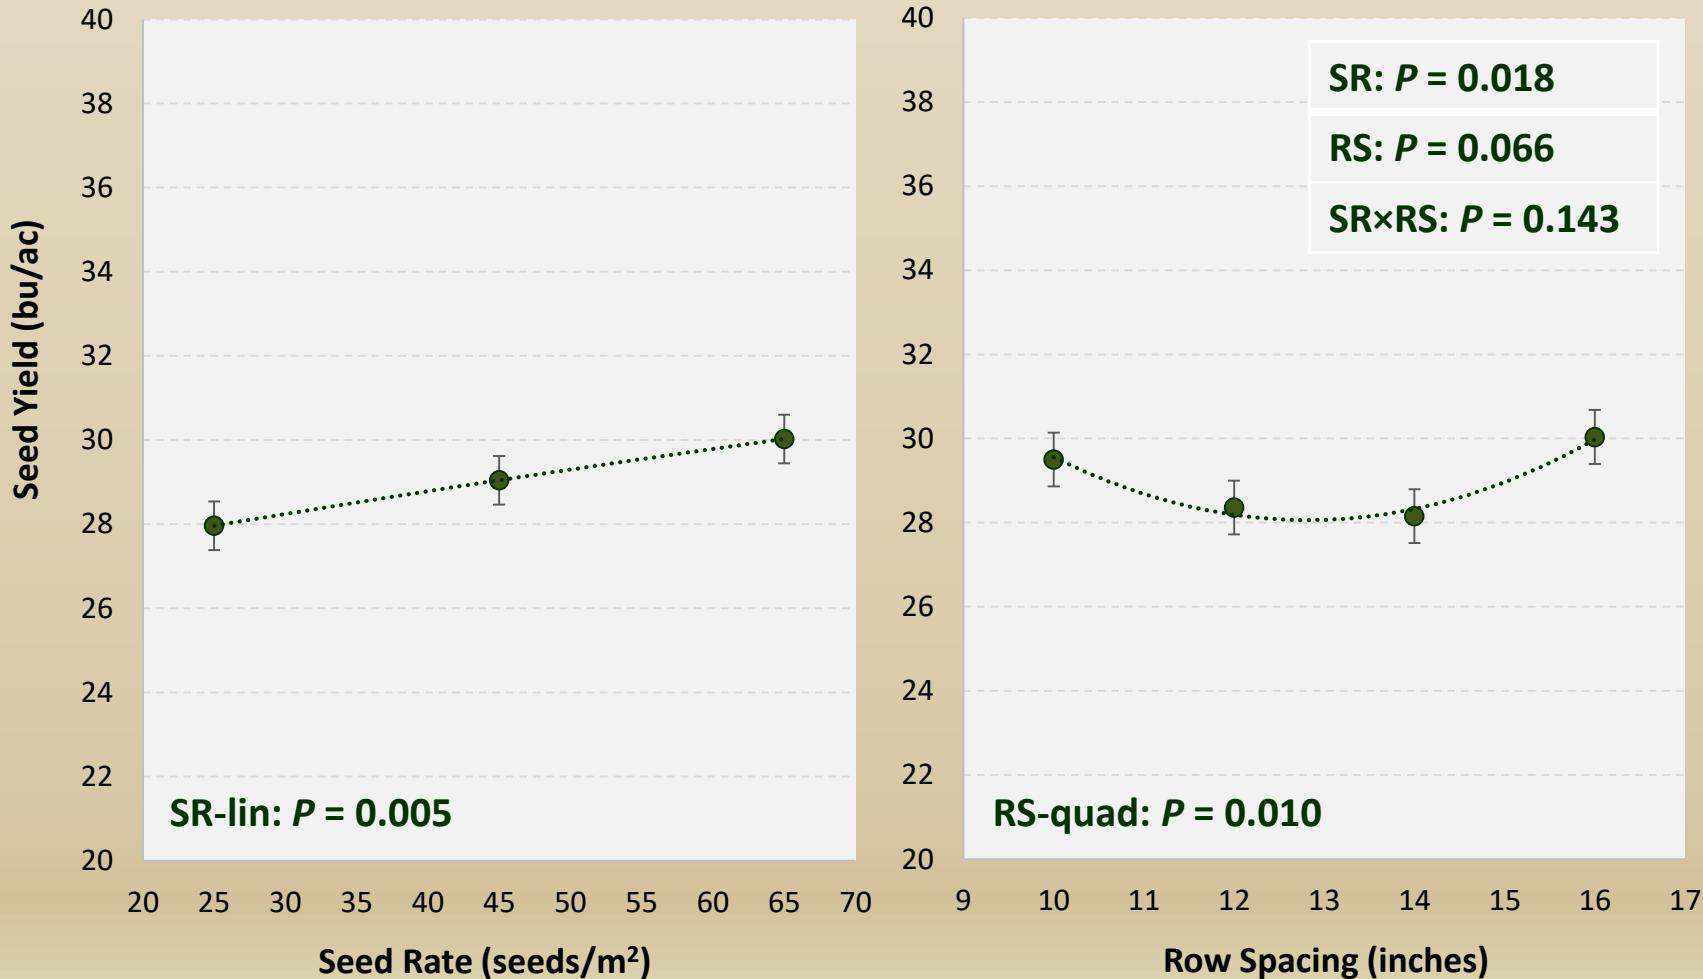

# Seed Rate & Row Spacing Effects on Faba bean Emergence (IH-18)

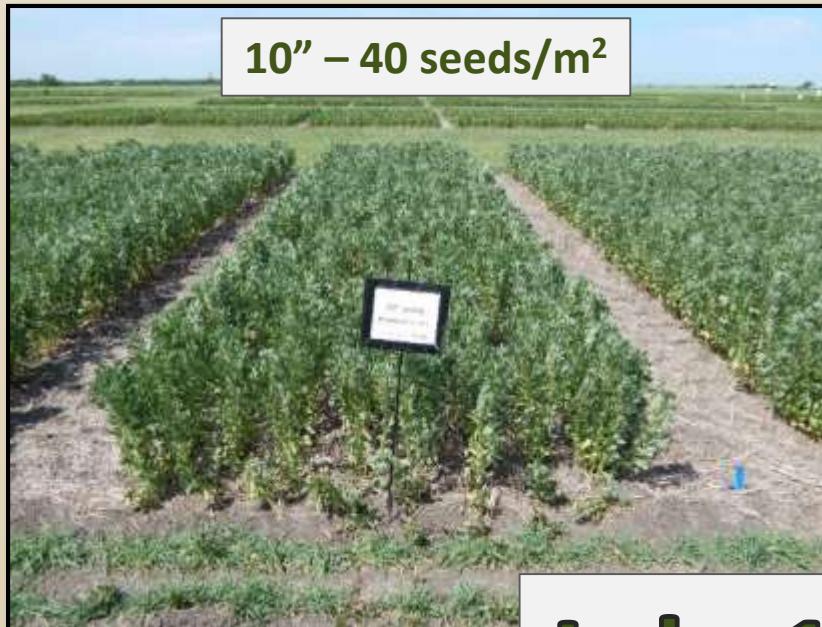

# Seed Rate & Row Spacing Effects on Faba bean Maturity (IH-18)

# Seed Rate & Row Spacing Effects on Faba bean Seed Yield (IH-18)

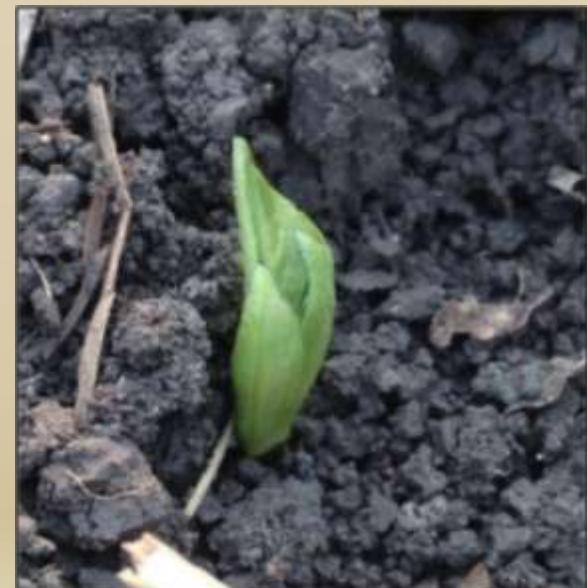

July 18, 2018

# Seed Rate & Row Spacing Effects on Faba bean

## Summary & Conclusions

- Results are not conclusive with only 1 site-year of data available
- Faba beans appeared to be relatively insensitive to row spacing within the 10-16" range evaluated and under relatively dry, low yielding conditions
- The observed seeding rate response was stronger than expected, possibly due to the extremely dry conditions
- Seeding rate appeared to have a greater impact on maturity and the ability of faba beans to compete with weeds than row spacing; however, weed pressure was very low in all treatments

# Flax Seed Treatment and Foliar Fungicide Options (SaskFlax-ADOPT)

# Flax Response to Seed Treatment & Foliar Fungicide Options

## Objectives

- To demonstrate the response of flax to various seed-applied and foliar fungicide options with a focus on establishment, maturity, and yield

## Treatments (9)

**Seed Treatments:** None, Vitaflo-280, Insure Pulse

**Foliar Fungicides\***: None, Headline EC, Priaxor

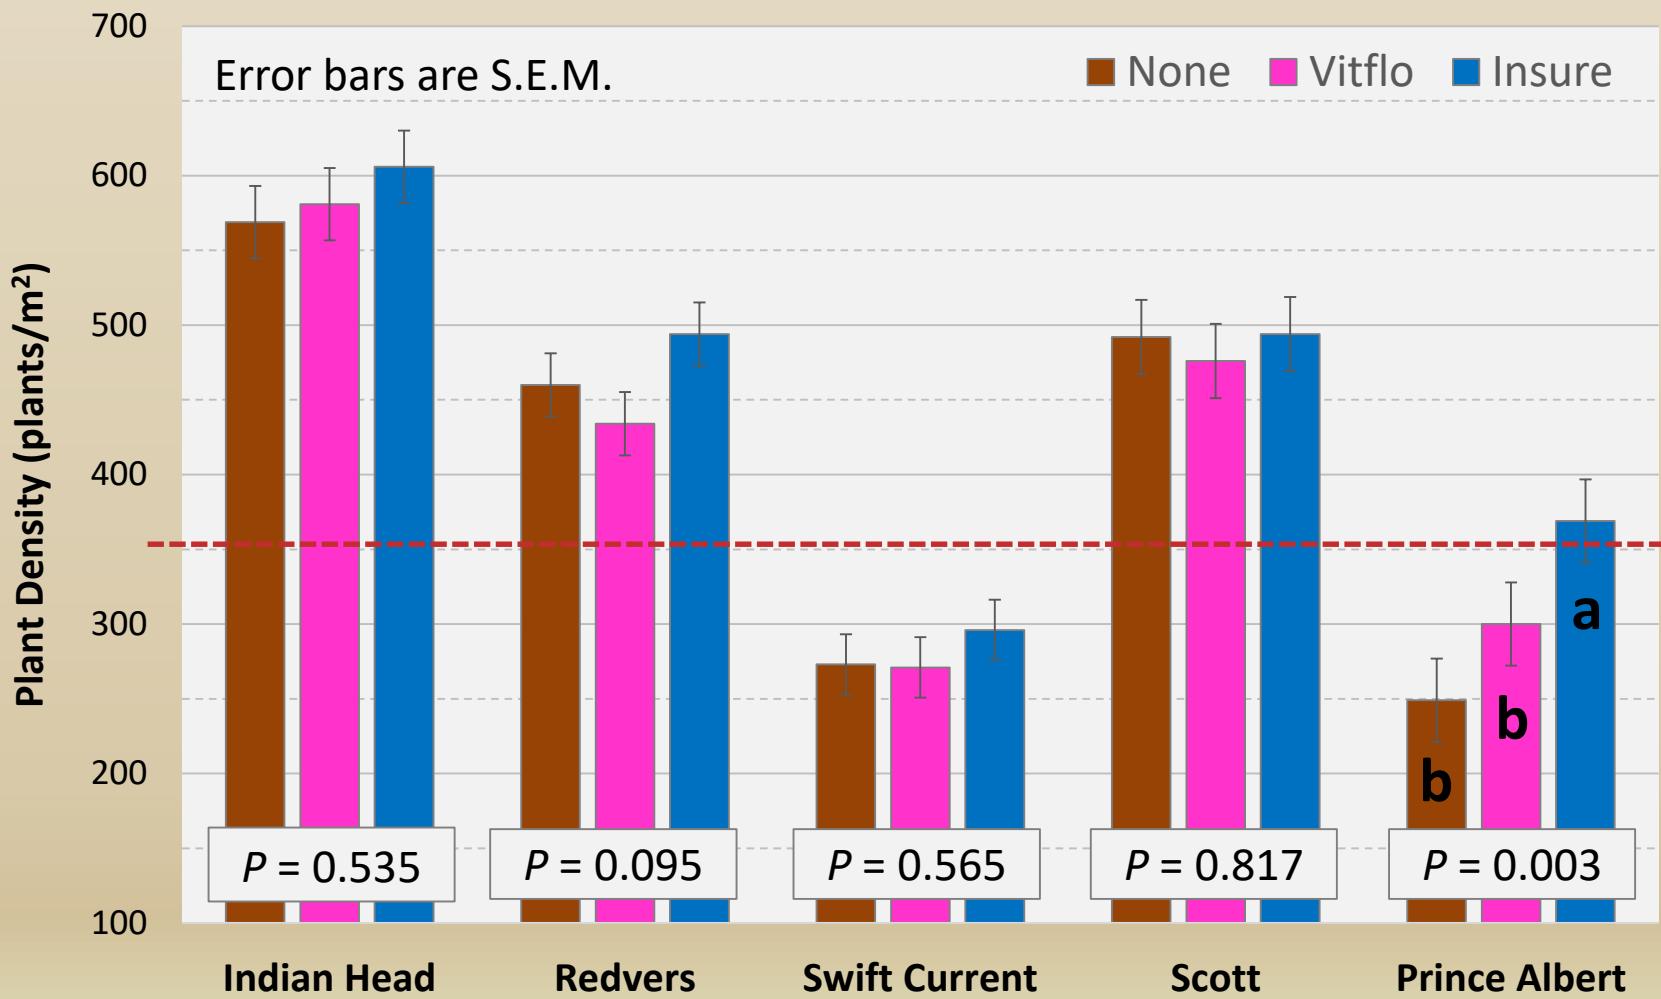

## Locations (5)

Indian Head, Redvers, Swift Current, Scott, & Prince Albert, Saskatchewan

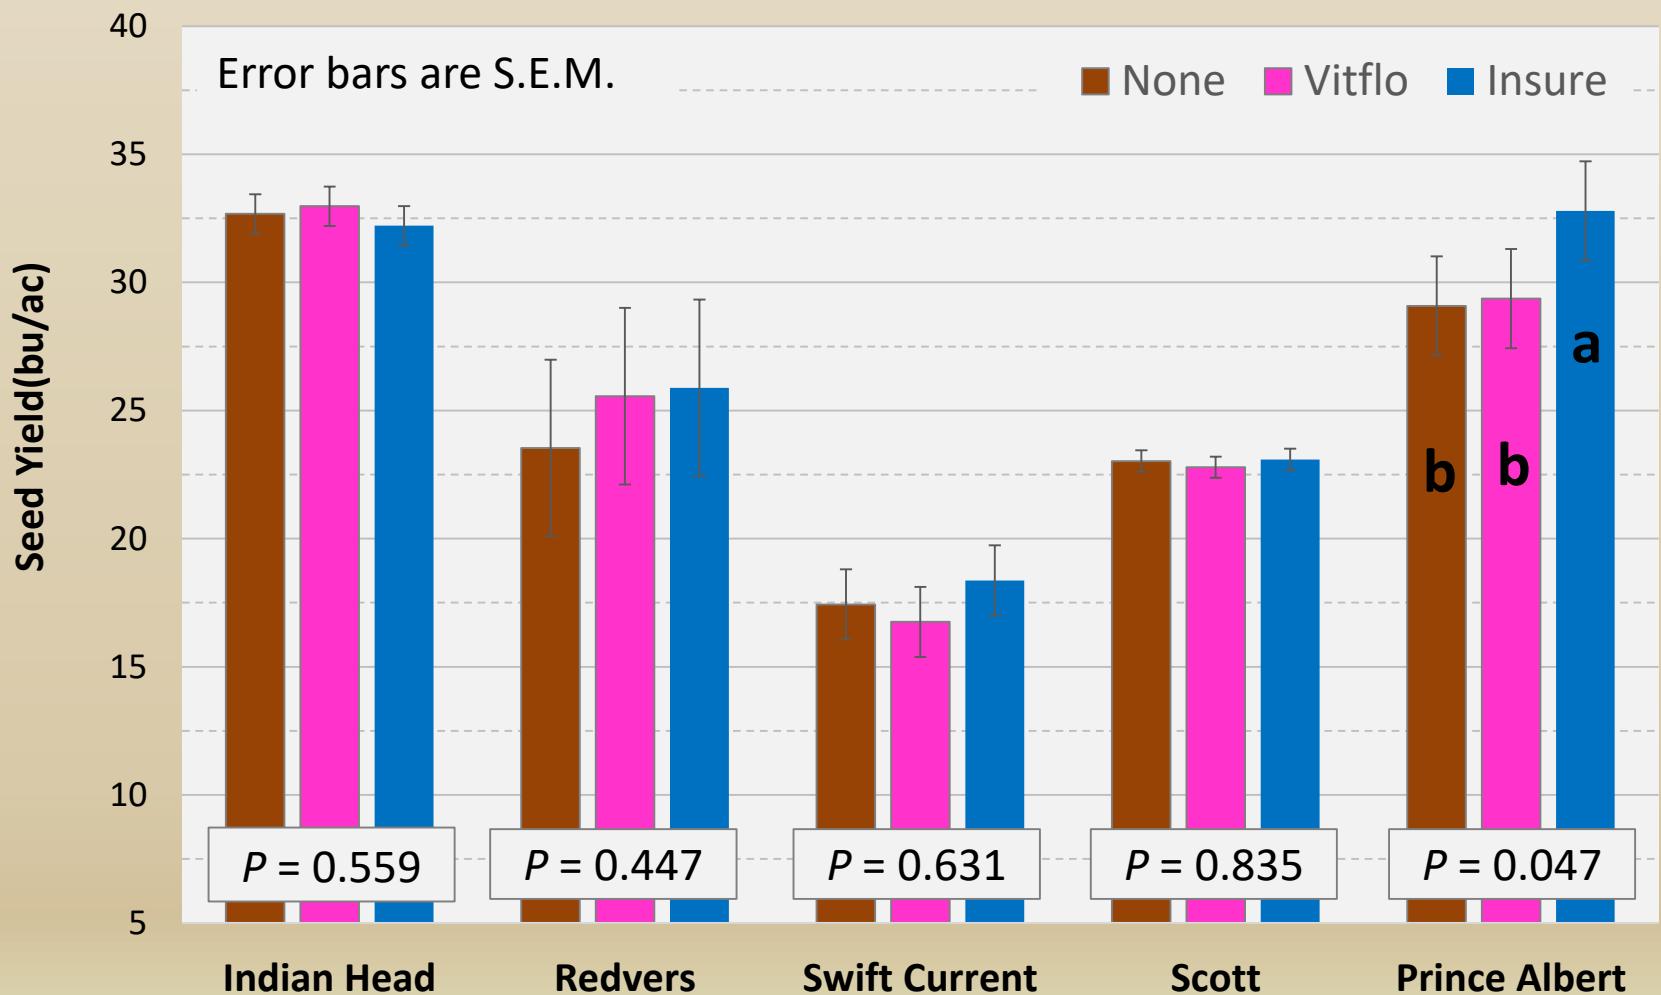

\*fungicides applied 7-10 after initiation of flowering in a minimum of 15 U.S. gal/ac solution volume

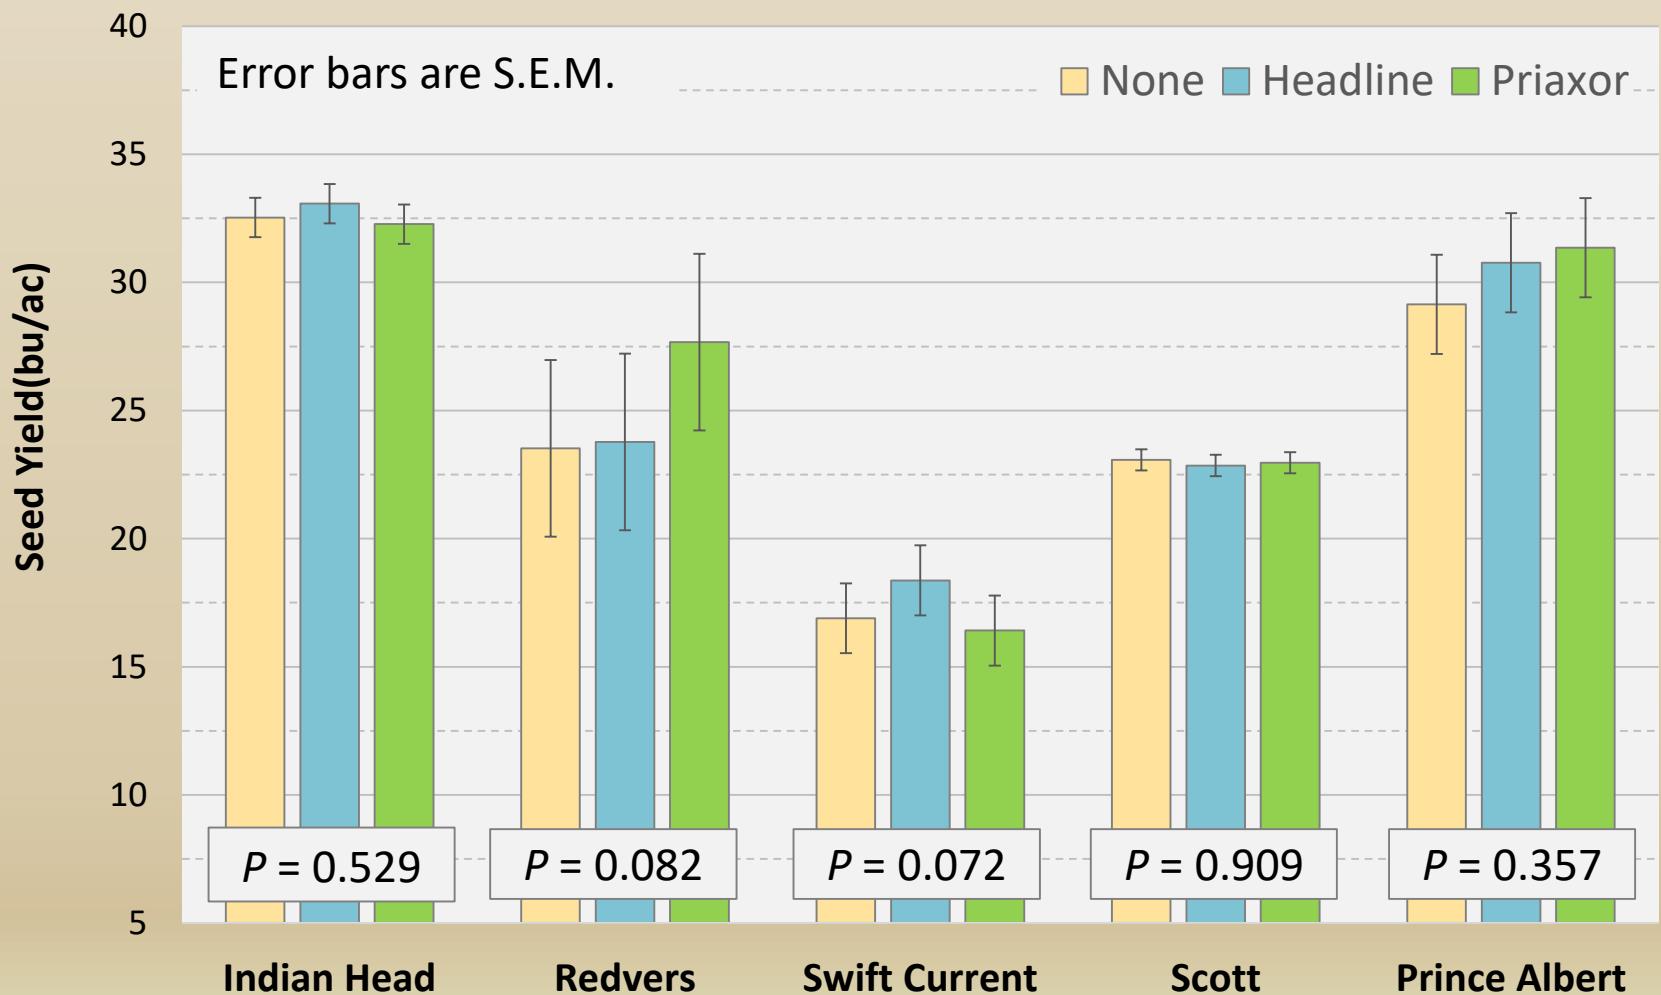

# Seed Treatment Effects on Flax Emergence (5 locations - 2018)

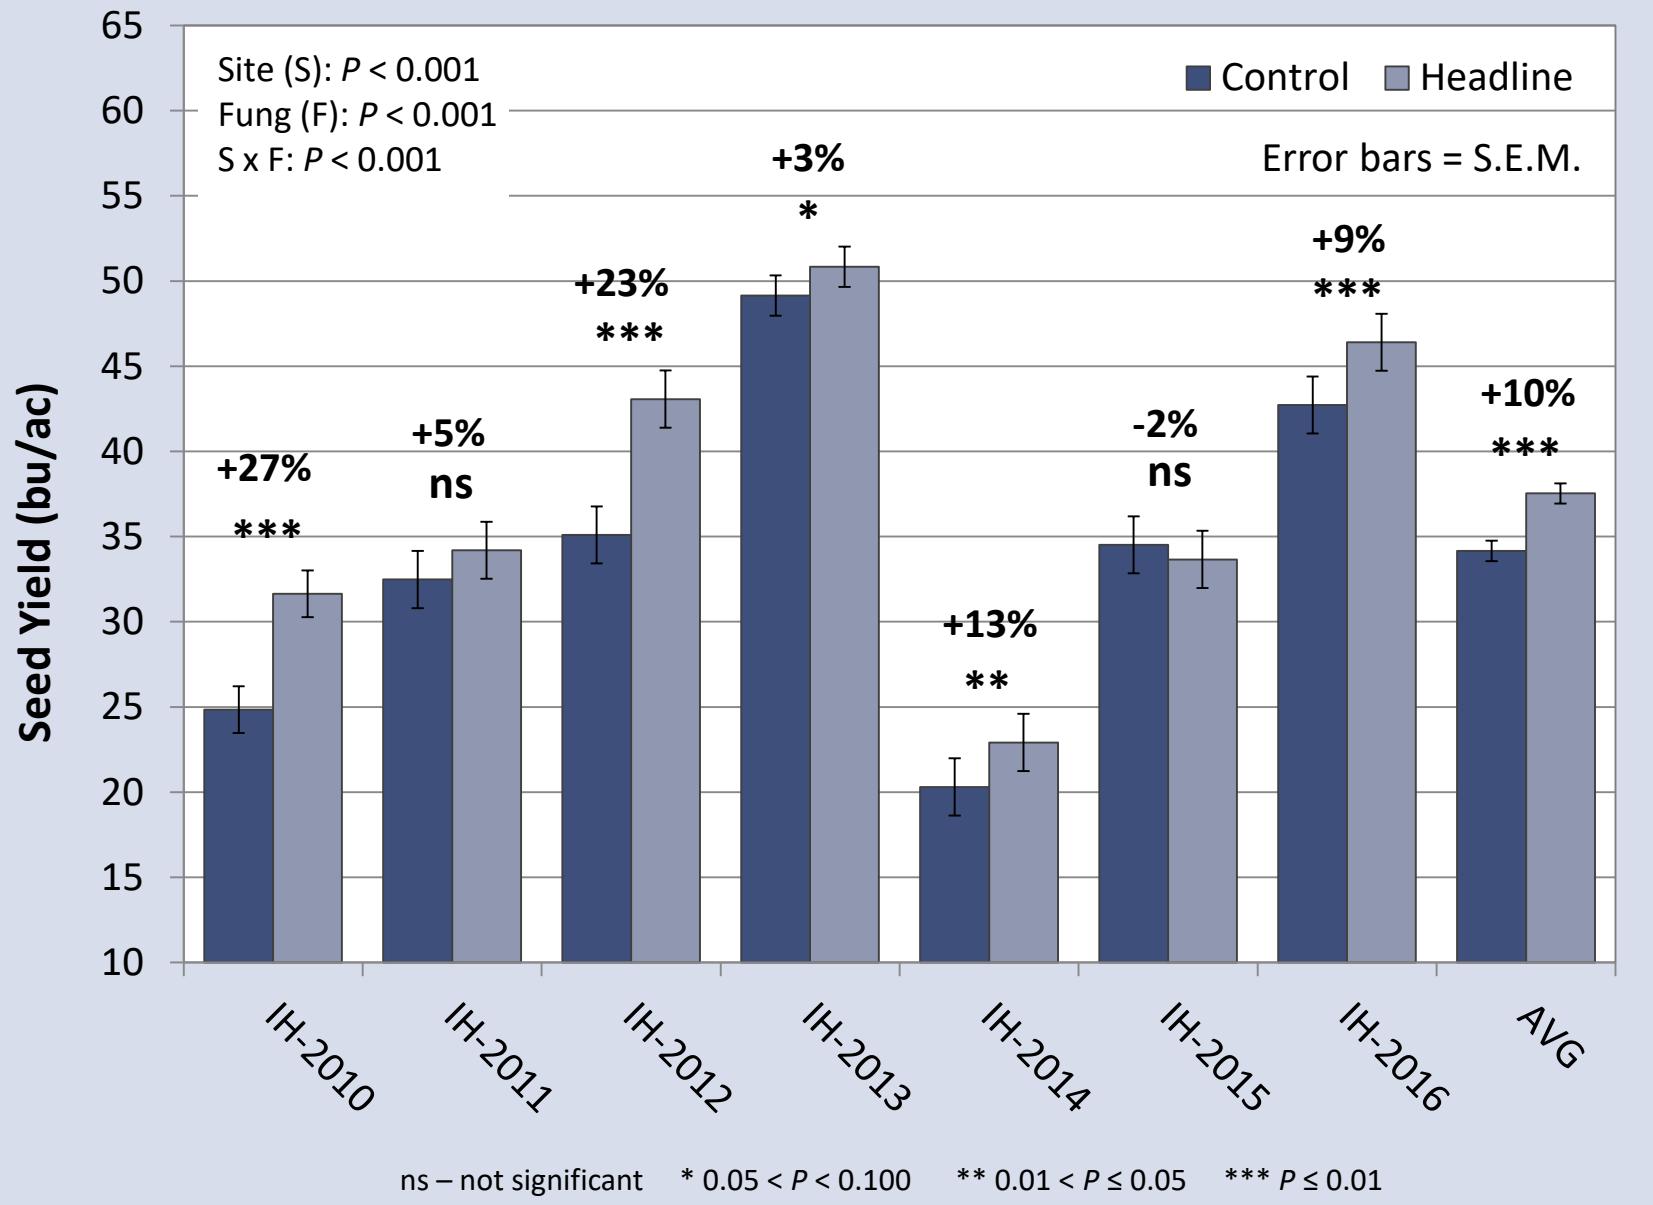

# Seed Treatment Effects on Flax Seed Yield (5 locations - 2018)

# Foliar Fungicide Effects on Flax Seed Yield (5 locations - 2018)

source: [www.flaxcouncil.ca](http://www.flaxcouncil.ca)

# Flax Response to Seed Treatment & Foliar Fungicide Options: Summary & Conclusions

- Flax response to seed treatment in small plot trials has been variable, with occasional benefits detected but a high frequency of non-responsive sites
- Significant responses have mostly been limited to higher plant populations which may or may not lead to yield benefits depending on the absolute numbers
- Probability of economic benefit is likely low with sound seed, normal seeding conditions, adequate seed rates, and no known history of root disease in flax (i.e. fusarium wilt, root rot/seedling blight)
- No responses to fungicide in the current trial – consistent with previous results showing no benefit under low disease pressure (all sites were dry)
- Past IHARF trials at Indian Head have shown at least marginally significant responses 5/7 seasons with an overall 10% yield benefit to fungicide

# Canola Phosphorus Fertilizer Form & *P. bilaiii* Inoculant (ADOPT)

# Canola Response to P Form & *P. bilaiii* Inoculant Indian Head 2018

## Objectives

- To demonstrate the relative crop safety and agronomic performance of seed-placed granular phosphorus (P) fertilizer forms with & without a P solubilizing *P. bilaiii* inoculant

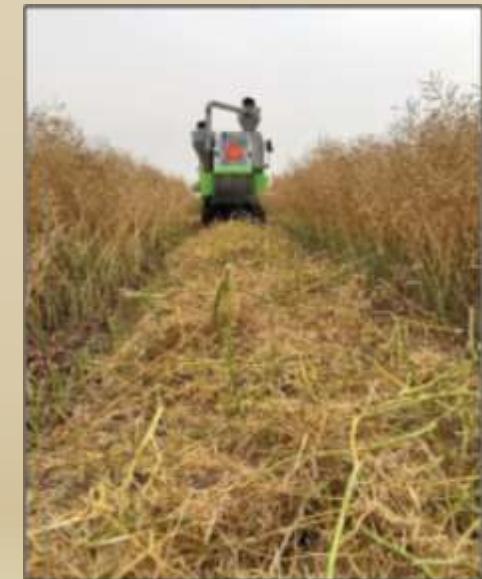

## Treatments (10)

**P Rates:** 0, 22, & 45 lb P<sub>2</sub>O<sub>5</sub>/ac

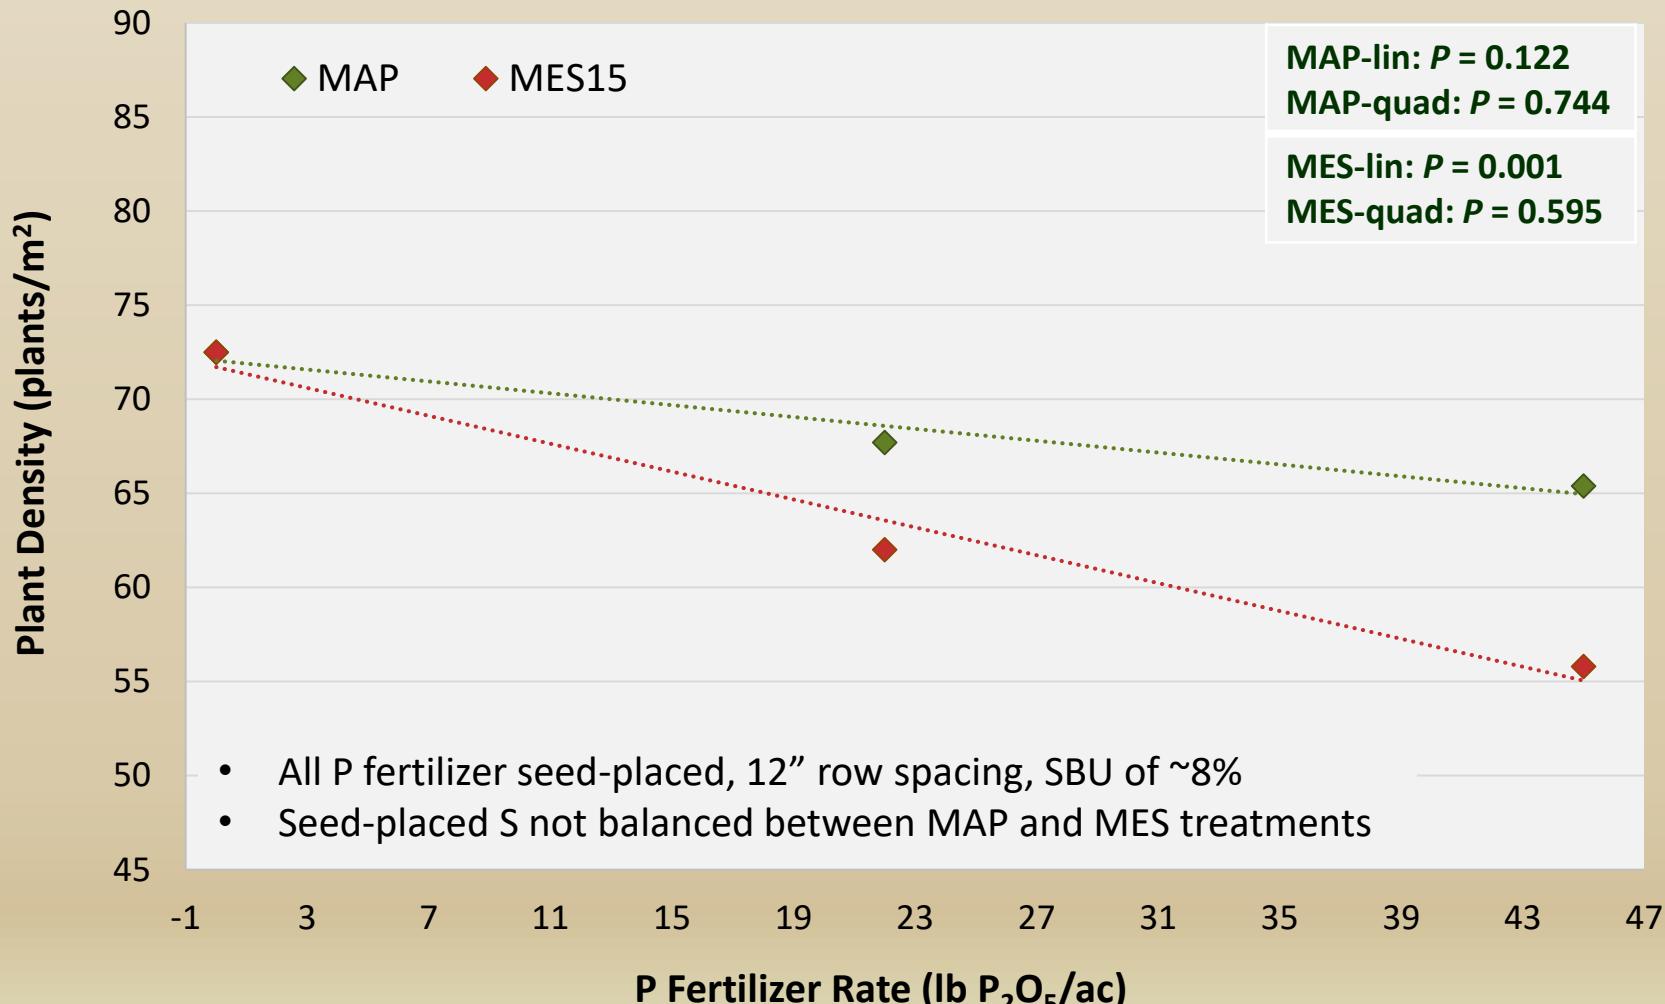

**P Forms:** MAP (11-52-0) or MES15 (13-33-0-15)

**Inoculant:** None vs label rate granular Jumpstart®

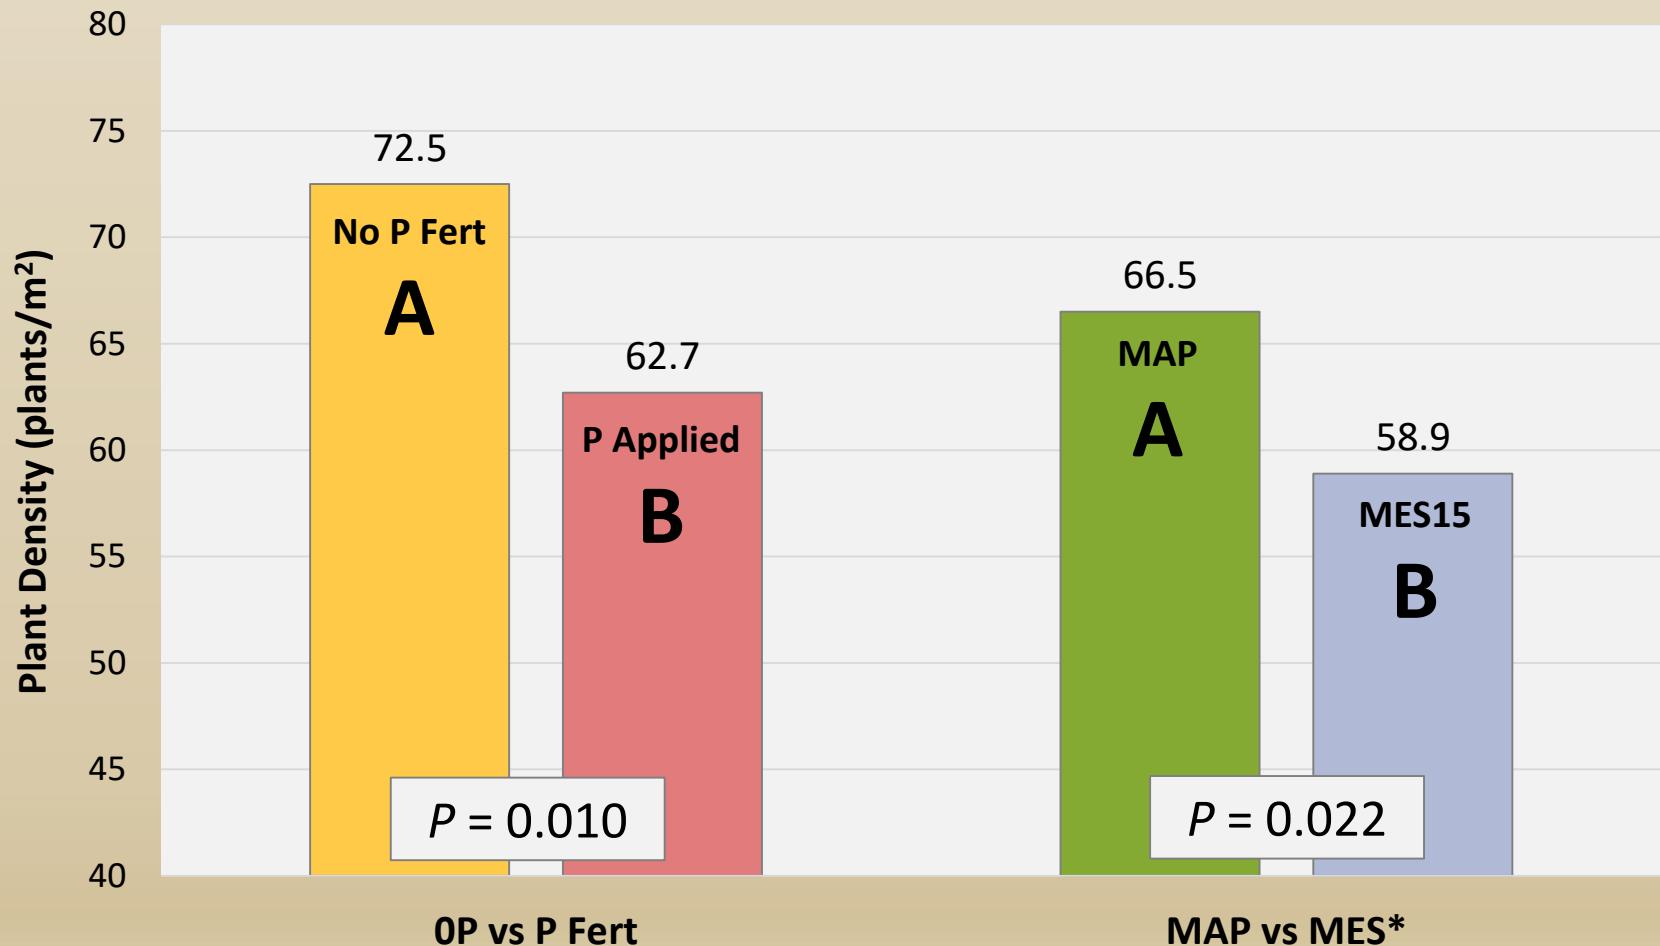

**Notes:** 7 ppm Olsen-P, pH 7.5, S.O.M. 5.9%; all P fertilizer seed-placed; broadcast K<sub>2</sub>SO<sub>4</sub> across entire site before seeding (S rates not balanced across treatments but non-limiting in all)

# P Rate x Form Effects on Canola Emergence (IH-18)

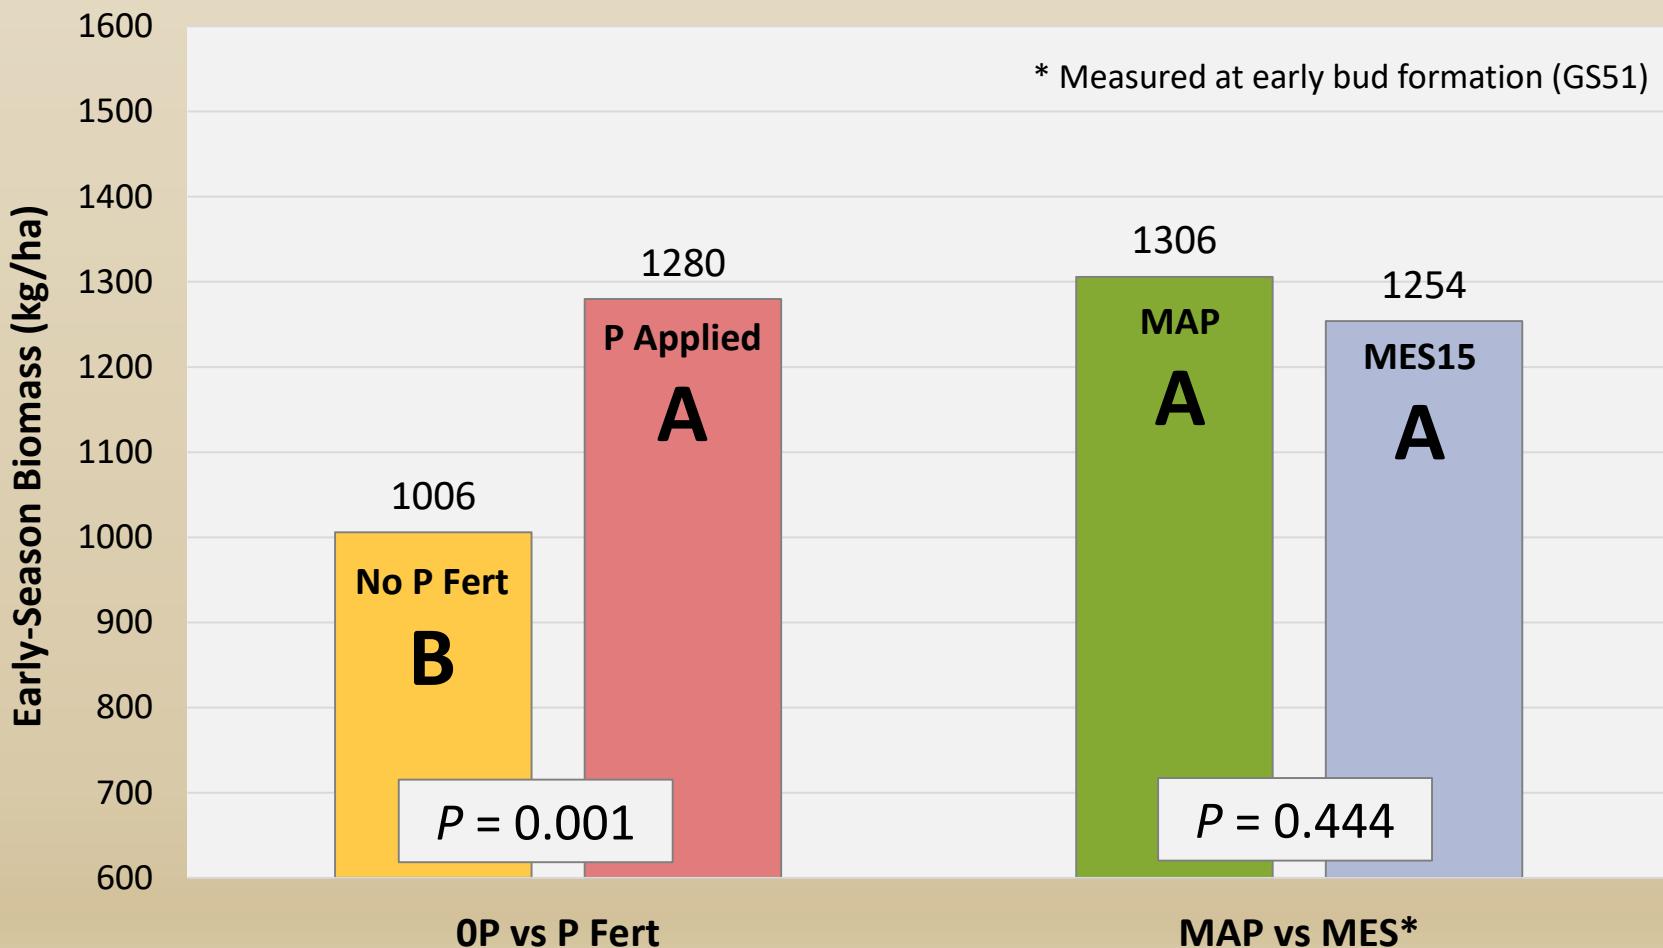

# Group Comparisons: Seed-Placed P Effects on Canola Emergence (IH-18)

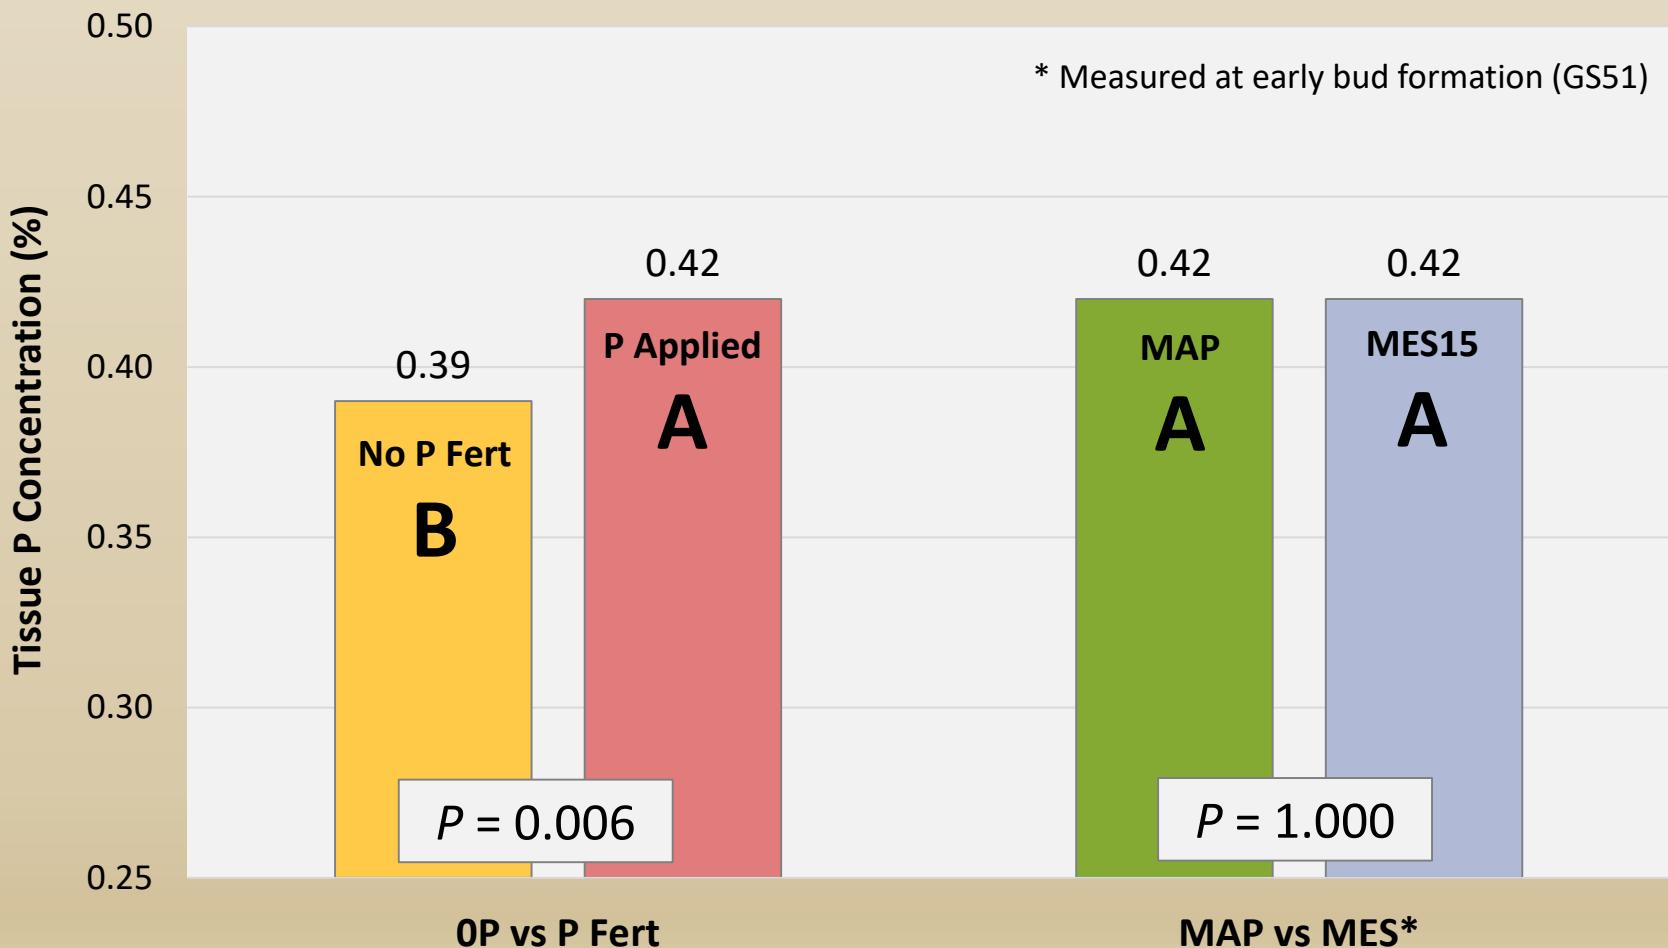

\* Seed-placed S was not balanced between MAP & MES

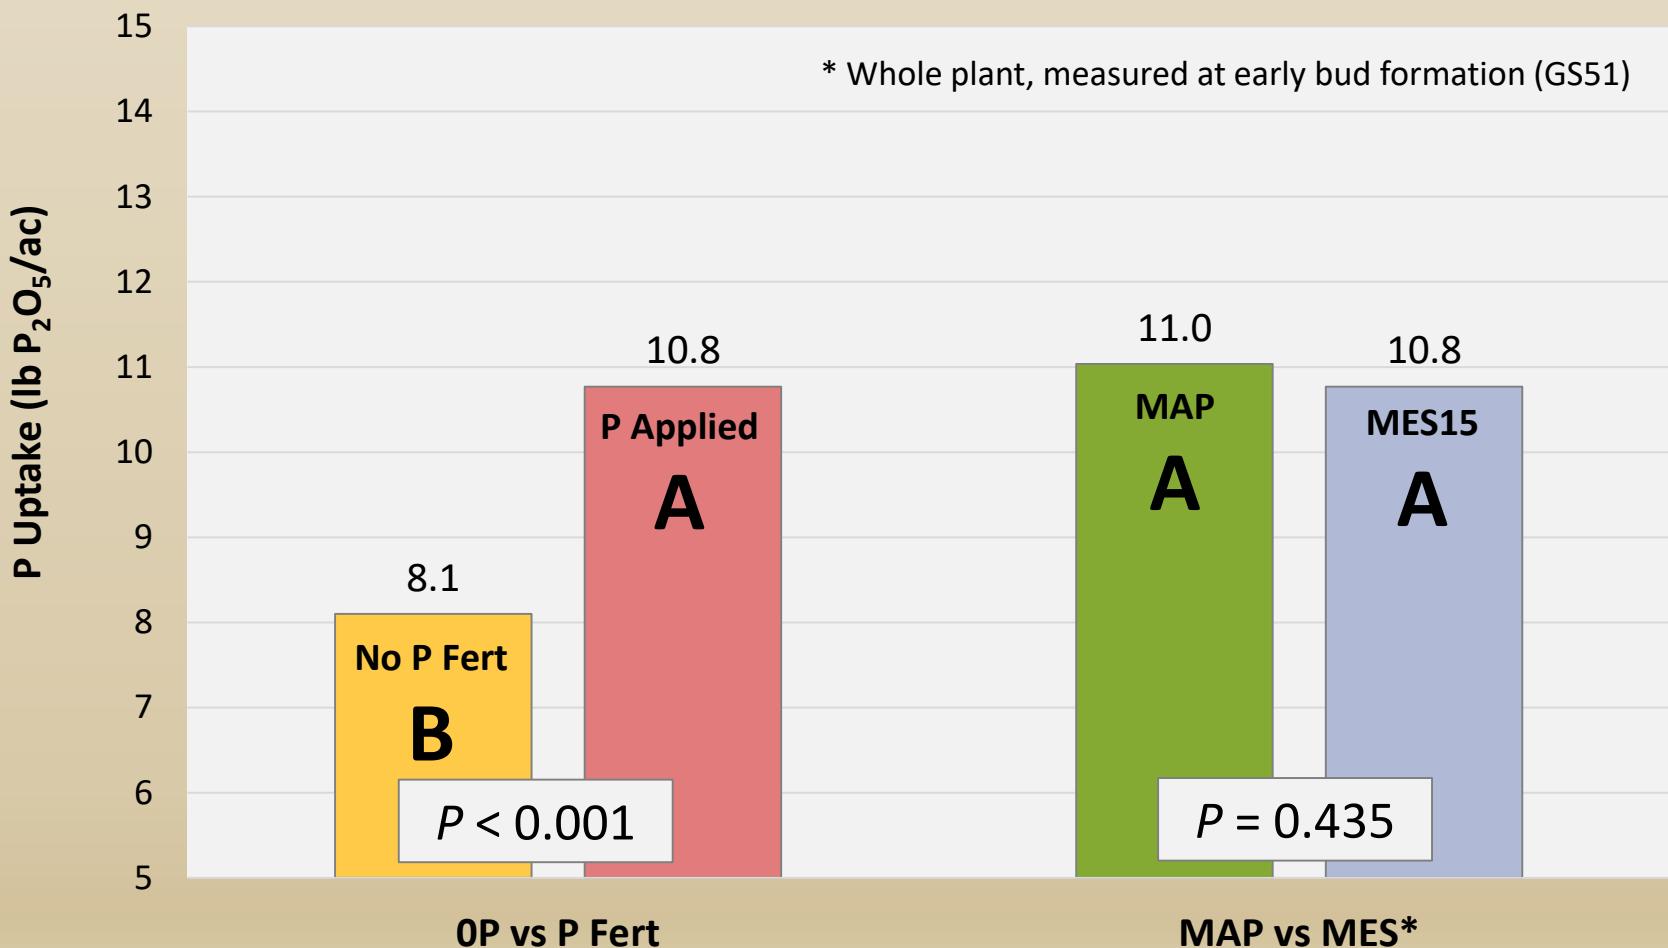

# Group Comparisons: Seed-Placed P Effects on Canola Growth (IH-18)

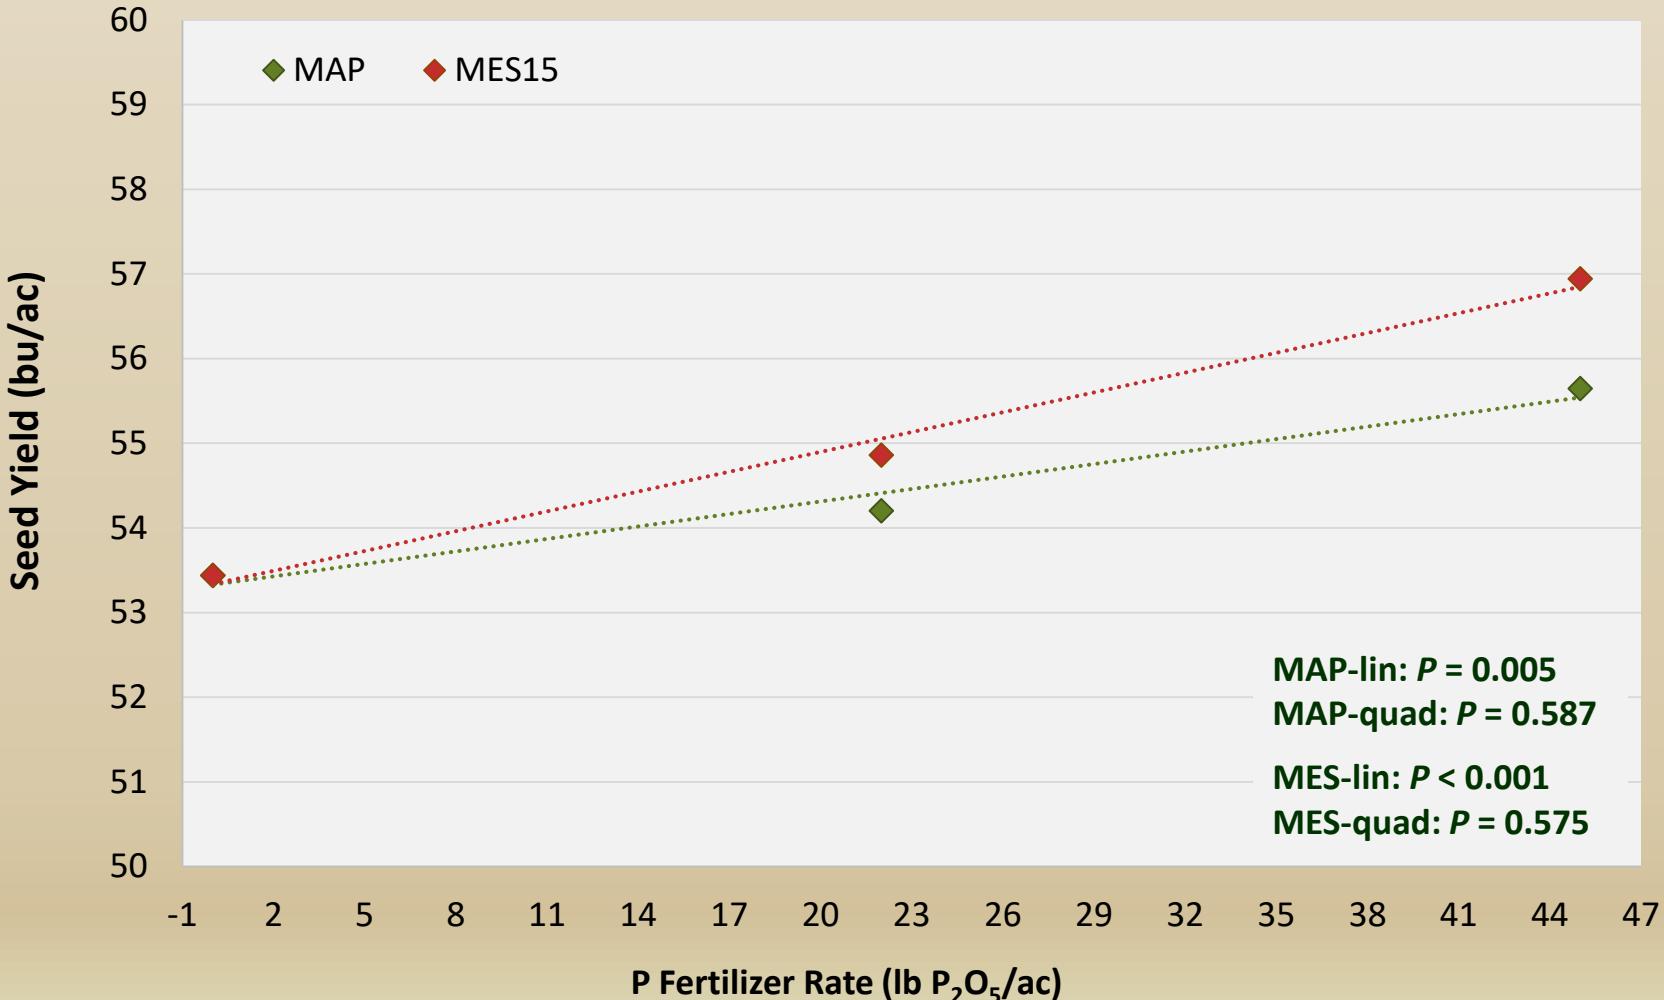

# Group Comparisons: Seed-Placed P Effects on Canola Tissue P (IH-18)

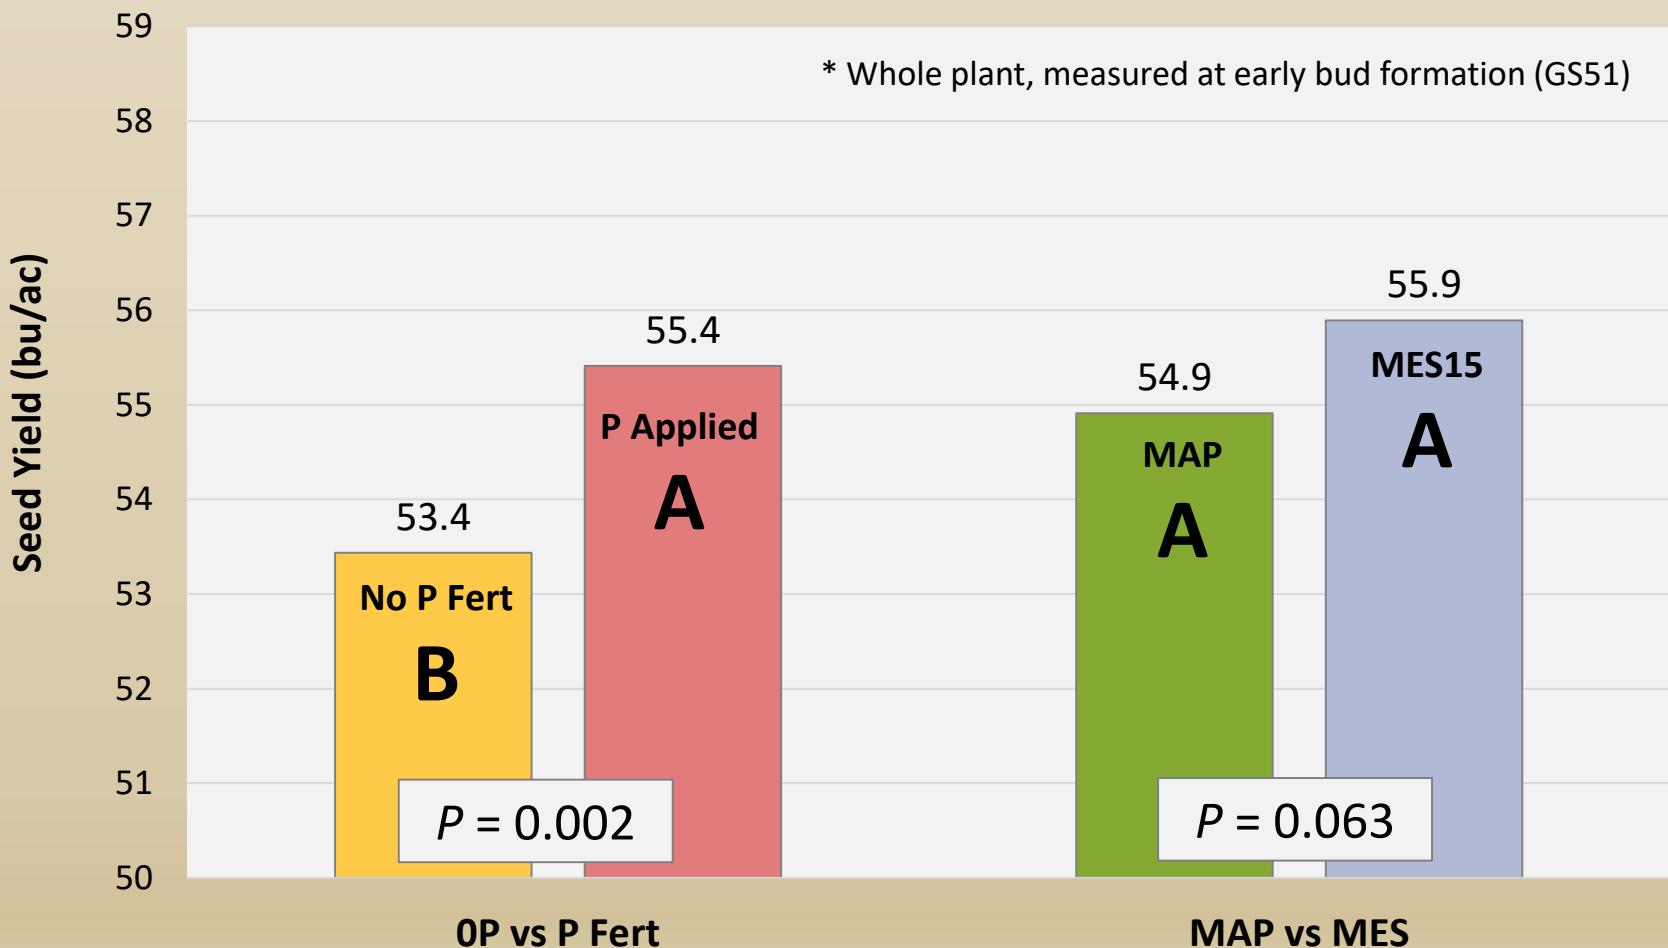

# Group Comparisons: Seed-Placed P Effects on Canola P Uptake (IH-18)

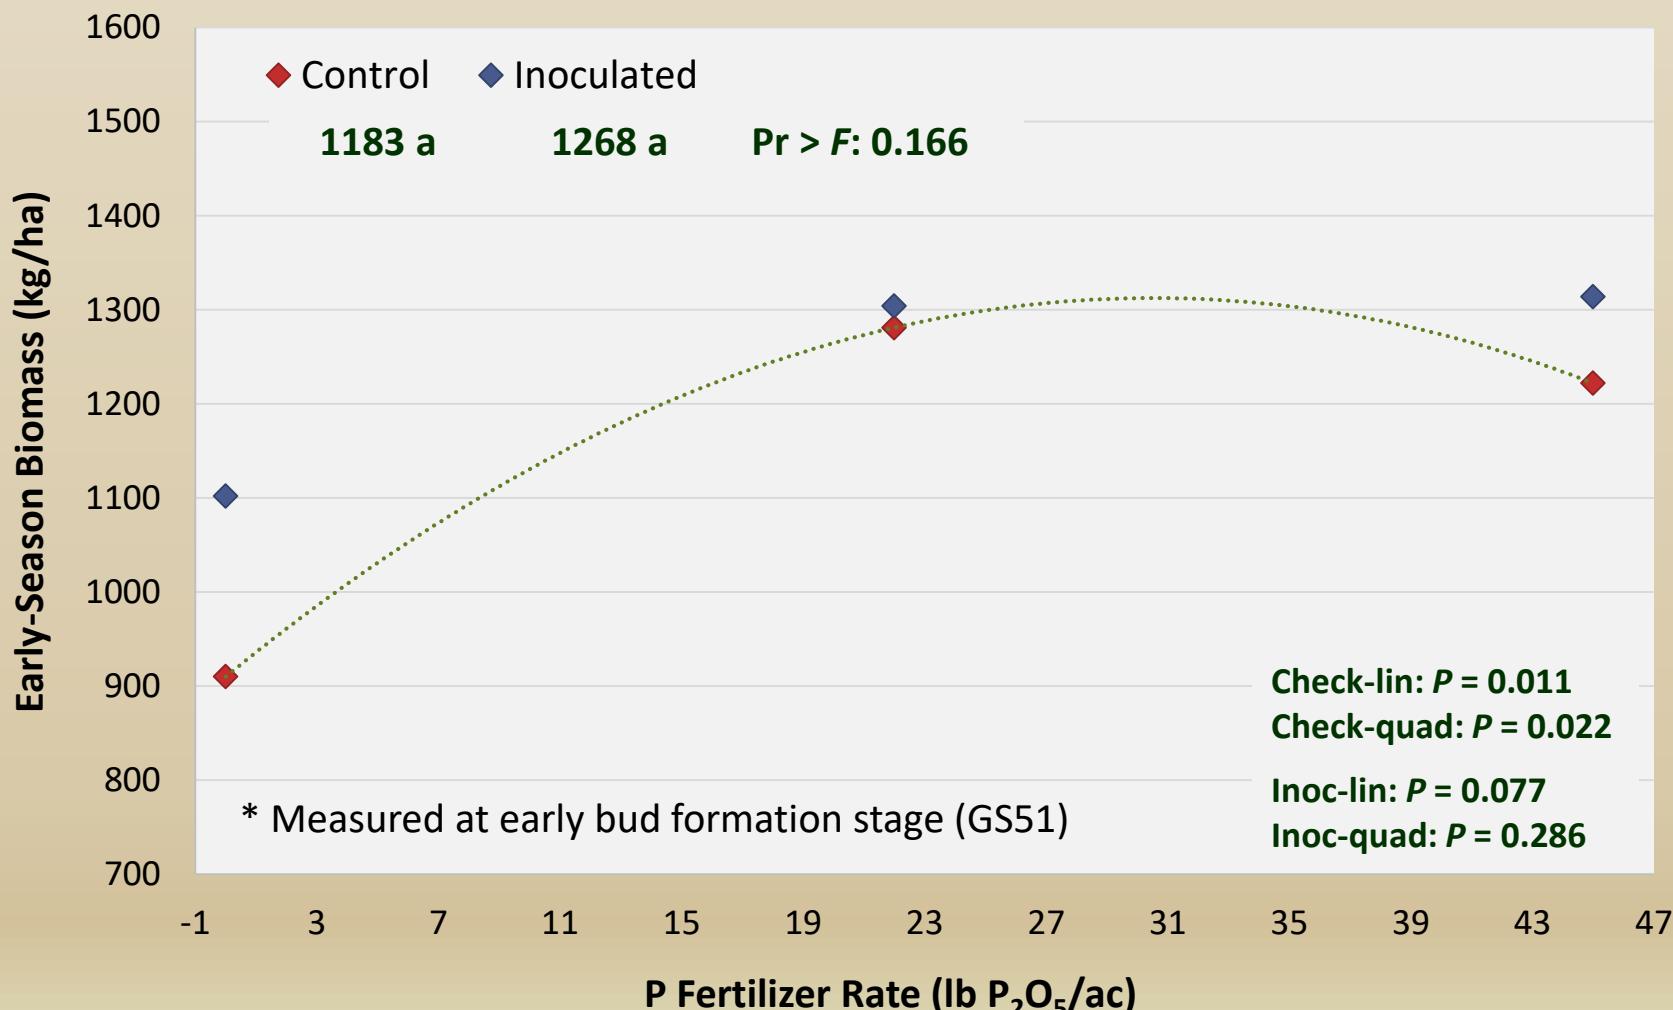

# P Rate x Form Effects on Canola Seed Yield (IH-18)

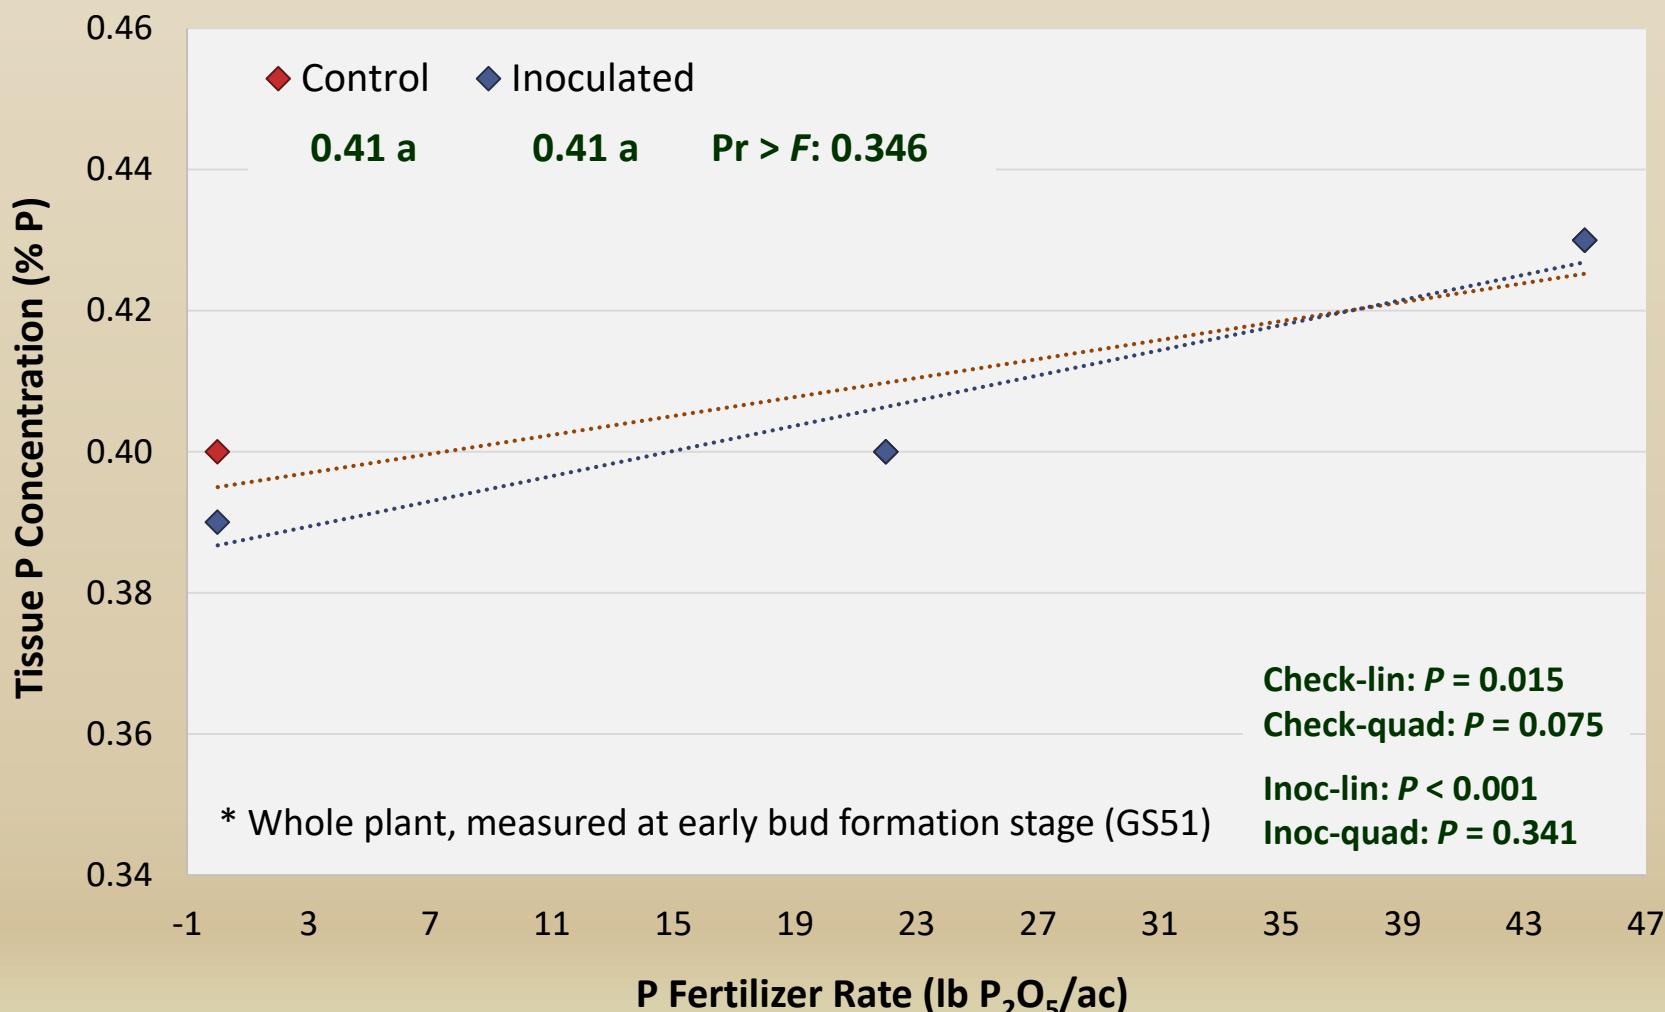

# Group Comparisons: Seed-Placed P Effects on Canola Yield (IH-18)

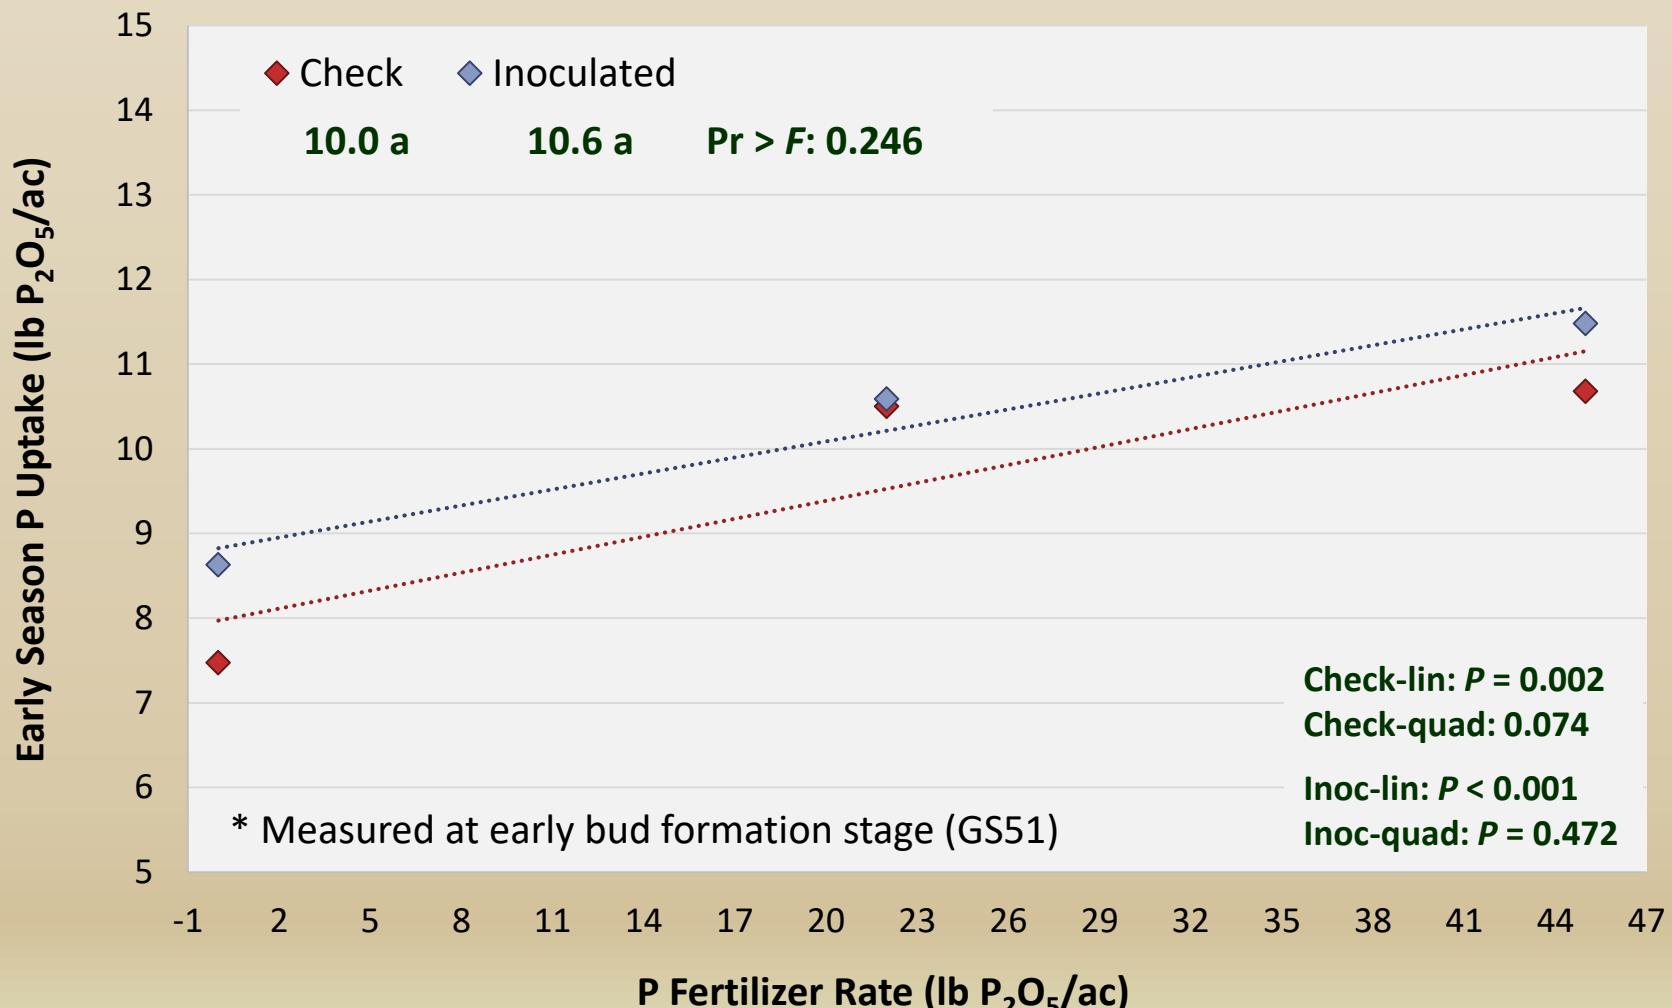

# P Rate x *P. bilaii* Effects on Early-Season Canola Growth (IH-18)

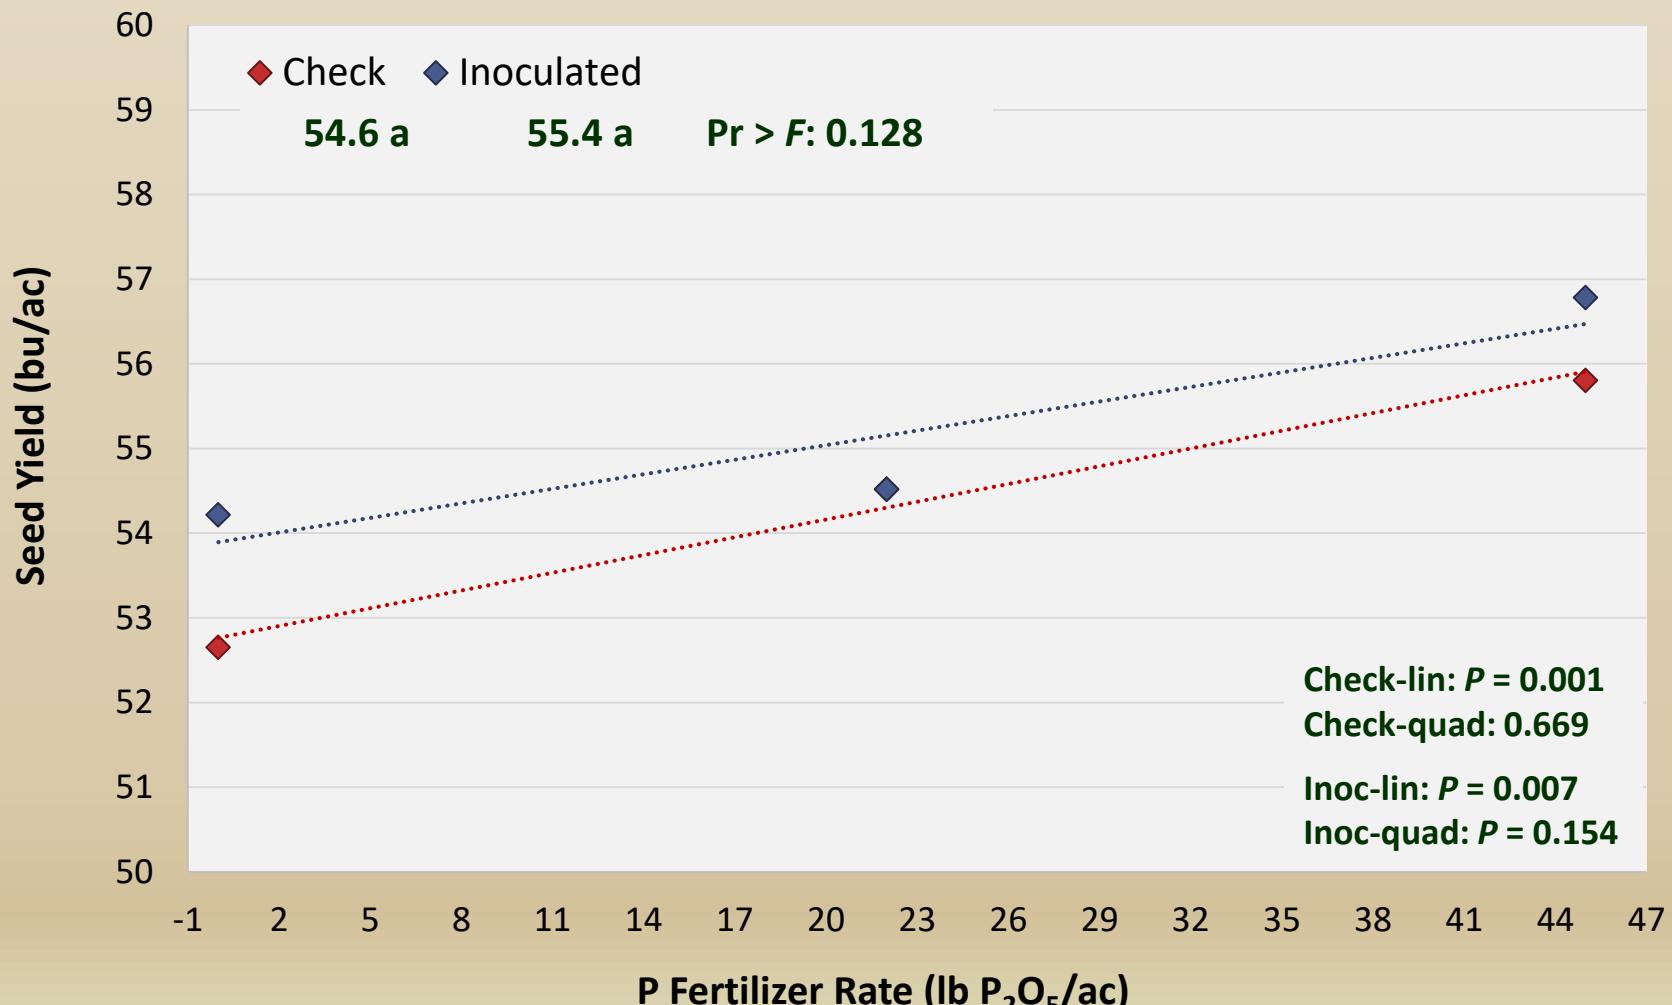

# P Rate x *P. bilaii* Effects on Canola Tissue P Concentration (IH-18)

# P Rate x *P. bilaii* Effects on Early-Season Canola P Uptake (IH-18)

# P Rate x *P. bilaiii* Effects on Canola Seed Yield (IH18)

# Canola Response to P Form & *P. bilaiii* Inoculant Summary & Conclusions

- Single site-year, results not to be considered conclusive
- High rates (45 lb P<sub>2</sub>O<sub>5</sub>/ac) of MES15 cause greater stand reductions than MAP when considered as a P source alone
  - Compared to equivalent blend of MAP/AS, MES15 has generally been shown to be safer for seed-placement; however, there is no agronomic reason to seed-place S (i.e. any benefits are usually logistic)
- Responses to P fertilizer in general were small but consistently significant
  - Similar early-season growth, tissue P concentrations, and P uptake for MAP and MES15, marginally significant yield benefit to MES15 (2% or 1 bu/ac;  $P = 0.063$ )
- Inoculation with *P. bilaiii* tended to increase early season biomass slightly in the absence of P fertilizer; however, there was no yield benefit and yield responses to P fertilization were similar regardless of inoculation

# 4R Nitrogen Fertilizer Management in Wheat & Canola (ADOPT)

# 4R N Management in Canola & Wheat

## Indian Head 2017

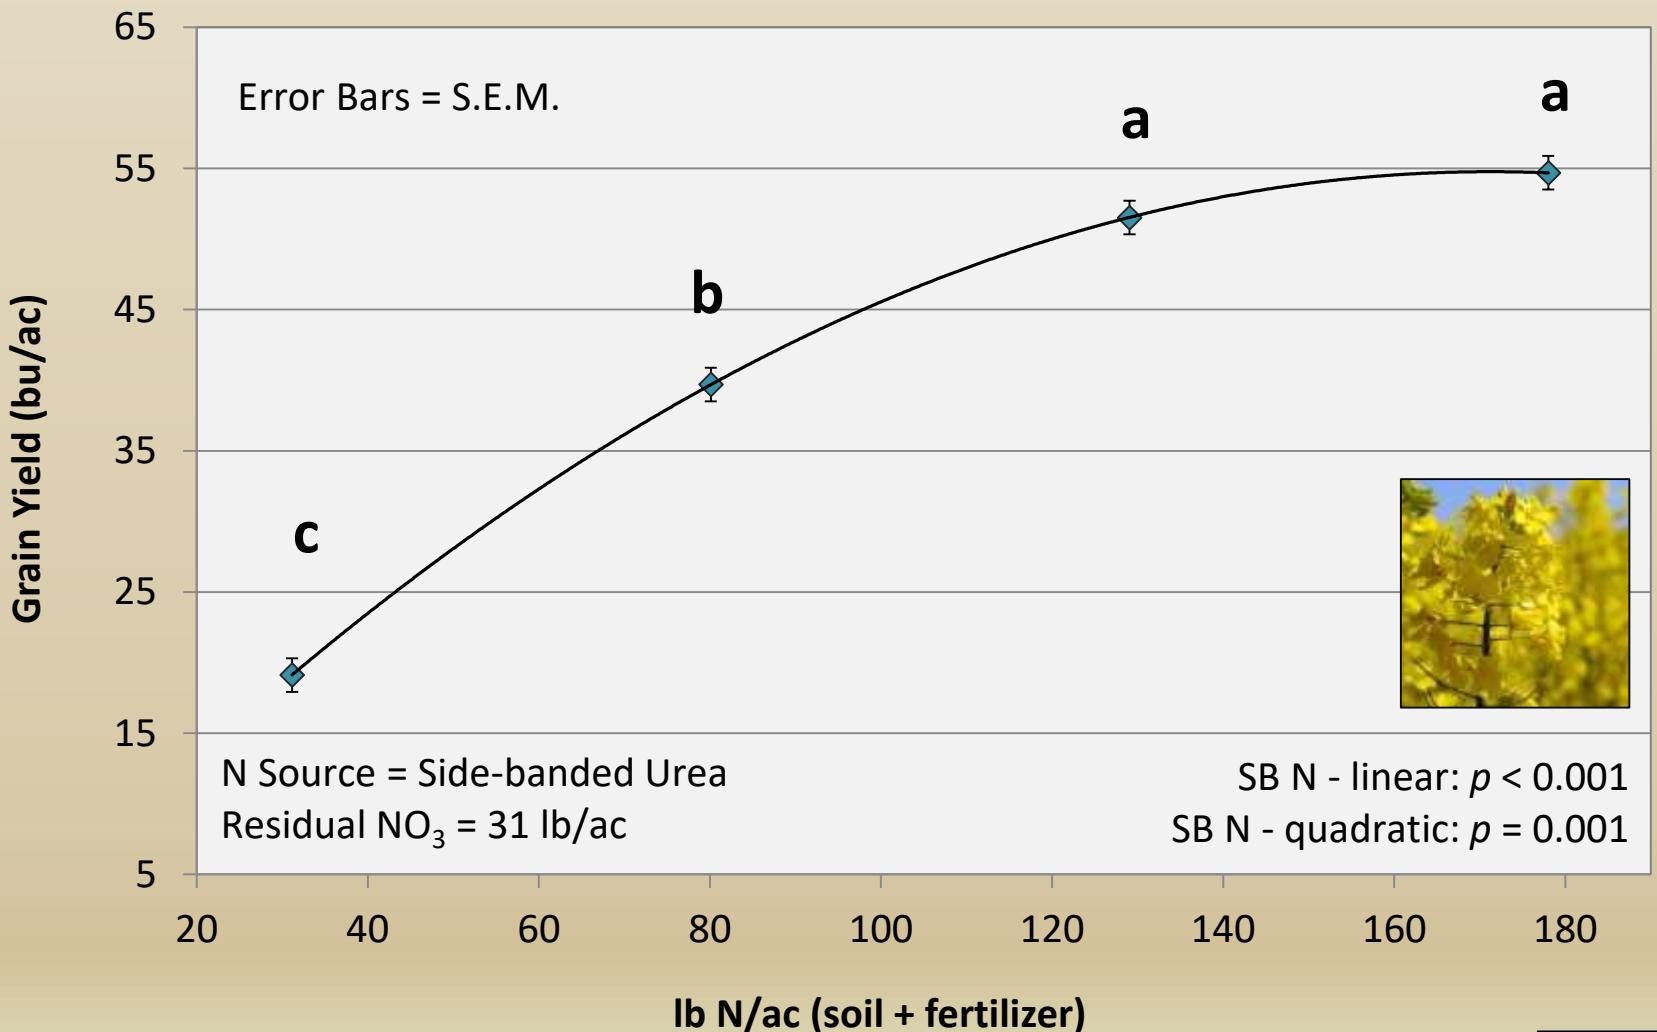

**Objectives:** To demonstrate crop response to varying rates of N along with different forms, timing & placement relative to side-banded, untreated urea

#	Form	Timing / Placement	Rate *
1	N/A	N/A	N/A
2	Urea (untreated)	Side-band (during seeding)	0.5x
3	Urea	Side-band	1.0x
4	Urea	Side-band	1.5x
5	Urea	Spring surface broadcast (pre-seed)	1.0x
6	Urea Ammonium-Nitrate (UAN)	Spring surface dribble-band	1.0x
7	Agrotain® (AT)	Spring surface broadcast	1.0x
8	SuperUrea® (SU)	Spring surface broadcast	1.0x
9	Urea / Urea	50:50 Split (side-band : in-crop)	1.0x
10	Urea / UAN	50:50 Split	1.0x
11	Urea / Agrotain®	50:50 Split	1.0x
12	Urea / SuperUrea®	50:50 Split	1.0x

\* 1x = 129 lb N/ac (soil + fertilizer) for canola & 116 lb/ac for wheat

## Summary & Conclusions

- From an agronomic perspective, it is difficult to improve upon side or mid-row banding a crop's entire N requirements during seeding under Prairie conditions
  - Incentives for considering alternative timing/placement options are usually logistic (i.e. limitations on amount of product that can be delivered through seeding implement; desire to handle less product during seeding, lower fertilizer prices in fall)
- Alternative timing/placement options can perform quite well but are usually more sensitive to environment than side or mid-row banding
  - Fall in-soil banding less susceptible to loss than surface broadcast applications, especially under dry conditions – in both cases fertilizer should not be applied until later in fall when soils have cooled as off much as possible
  - Split applications can work quite well provided that there is enough moisture to move N applied in-crop into the rooting zone but past research in western Canada has not generally shown any agronomic advantage over banding the entire amount during seeding
- EEF products do not always provide economic benefits but can reduce the risk of loss particularly when timing/placement options are not ideal
  - Choose a product that protects against the type of loss(es) that is/are most likely to occur

# Wheat Response to Various Inputs Alone and in Combination (ADOPT)

# ADOPT Wheat Input Demonstration

## Indian Head 2018

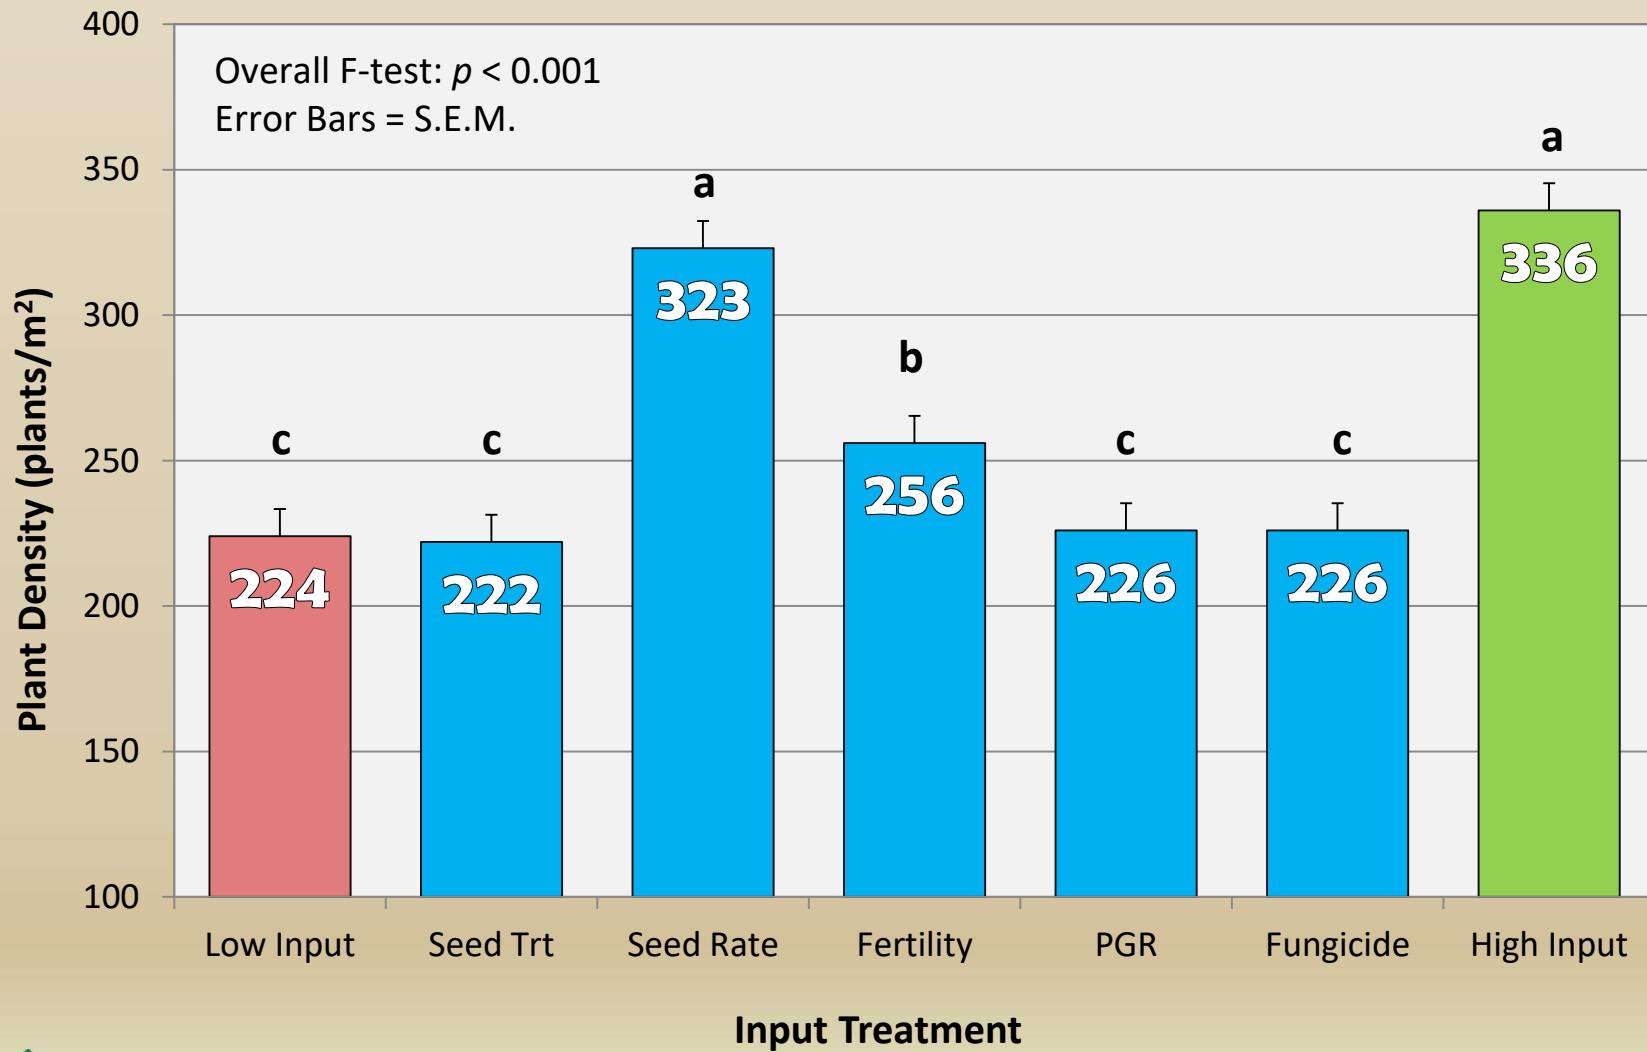

**Objectives:** To demonstrate agronomic and economic responses of CWRS wheat to various crop inputs both individually and collectively

#	Name	Seed Trt (no/yes)	Seed Rate (seeds/m <sup>2</sup> )	Fertility (lb/ac N-P <sub>2</sub> O <sub>5</sub> -K <sub>2</sub> O-S)	PGR (no/yes)	Fungicide (no/yes)
1	Low Input	No	250	80-18-9-9	No	No
2	Seed-Trt	Yes	250	80-18-9-9	No	No
3	Seed Rate	No	400	80-18-9-9	No	No
4	Fertility	No	250	120-36-18-18	No	No
5	PGR	No	250	80-18-9-9	Yes	No

<sup>z</sup> Not adjusted for differences in seeding rate between Trt. 2 and 7

<sup>y</sup> Assumes certified seed price of \$0.478/kg (\$478/tonne)

<sup>x</sup> Assumes \$725/tonne for MAP and \$525/tonne for urea – K and S costs excluded

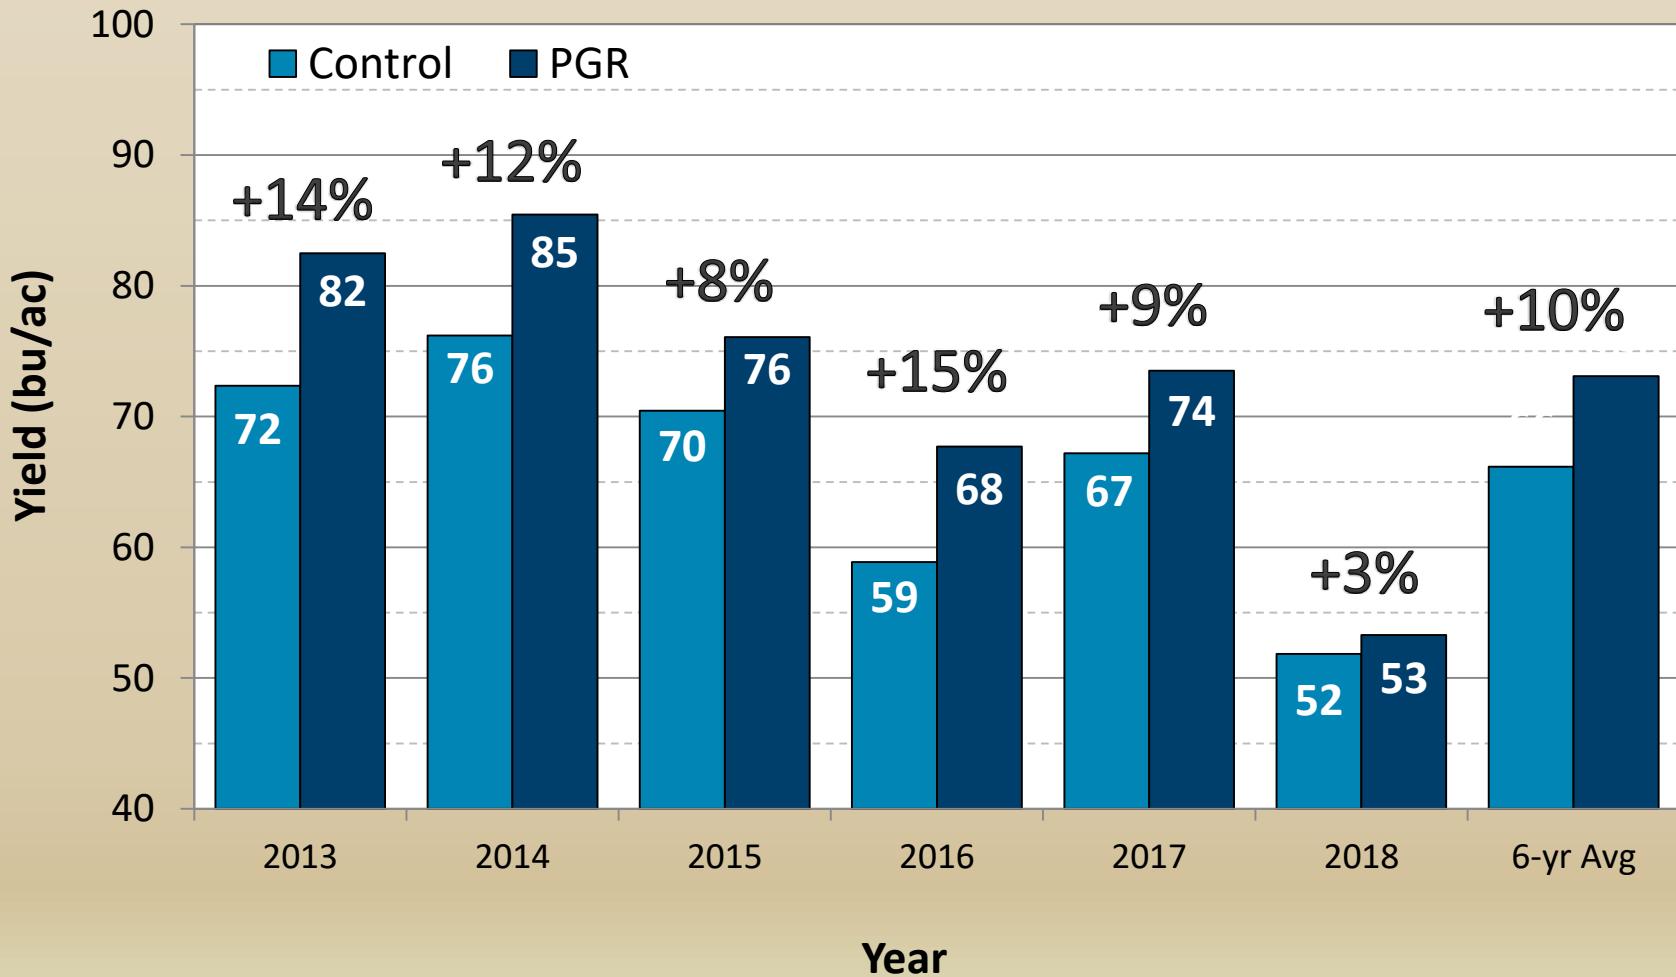

<sup>w</sup> Includes SRP of products plus \$5/ac application cost

<sup>v</sup> Based on actual yields and a CWRS wheat price of \$257/Mt (\$7/bu) regardless of quality

<sup>u</sup> Values do not take into account all production costs and are only estimates – actual expenses/revenues may vary

# Average PGR Effects on Wheat Yield
